# Introduction

Think about your own experiences in math class - did you look forward to learning math? Were you excited about math and confident in yourself as a mathematical thinker?

The way math is taught in schools is very different from how many students' parents and family members learned math in school. Math used to be taught in a way that emphasized being able to do procedures correctly, rather than understanding the big ideas in math. Students who didn't understand the steps in a procedure or weren't fast enough were made to feel like they were *bad at math*, and many developed feelings of fear or anxiety around math and their confidence in themselves as capable math learners decreased as they grew up. Current research indicates that our brains learn math primarily by building a framework of interconnected ideas, and connecting new ideas to what we already know.

As math instructional specialists, we wanted a resource to share with families looking for ways to support their children with math, so we created this guidebook. It is intended to be an overview of the major work of each grade, as well as general guidance for how to support your child develop a growth mindset and become a confident math thinker.

For more specific resources about what your child is learning in math, and how you can support them at home, please reach out to your child's school for family-facing curricular material.

# *Ways of Teaching and Learning Math*

### A Family-Friendly Guide

The NYCPS Math Shifts are designed to help children become confident and capable mathematicians. They are based on how the brain learns best: by focusing, connecting ideas, practicing skills, and applying math in real life.

## 1. Focus on What Matters Most

Children learn best when they spend more time on the most important math for their grade. This helps them build a strong foundation before moving on to more complex work.

## 2. Building Connections Across Grades

Math makes more sense when ideas build on each other. The shifts make sure each grade connects to the next, so your child sees math as a story that grows over time.

## 3. A Balanced Approach to Rigor

Math is more than memorizing facts. Students need to:

- Understand concepts (know why math works).
- Apply math to real-world problems (know when to use math).

The shifts focus on both so children grow as flexible problem-solvers.

## 4. Supporting Every Learner

When classrooms encourage students to explain their thinking and use different strategies, every child has a voice. This helps all students, including those who may not have seen themselves as "math people," feel confident and successful.

In short: The NYCPS Math Shifts are about teaching math the way children learn best—deeply, step by step, and with opportunities to practice and apply. With these shifts, every student can see themselves as a mathematician.

# Supporting Your Child with Math at Home

| | |
|---|---|
| 1. Start by naming and noticing | *What are you noticing here?*<br>*What's going on in this problem? Can you read it out loud/Can I read it to you? Say it in your own words.*<br>*What feels important in this situation/problem?*<br>*What do you see? Do you think it might be important?* |
| 2. Focus on sense-making | Have you seen a problem like this before? How could that help us?<br>What parts of this problem/situation make sense to you?<br>What do the numbers in the situation represent or mean?<br>Try using "friendly" numbers. |
| 3. Encourage the use of models and pictures | Let's make a sketch of this situation!<br>What would this look like as a picture?<br>Could you make a model of the situation? |
| 4. Focus on the strategy, not the answer | Show/tell me what you tried so far.<br>What's your plan, is there a strategy you could try?<br>Hmm...what's a way we could get started?<br>I wonder if we make a sketch to get started. |
| 5. Encourage effort and progress | You did not give up when you got stuck.<br>What a nice idea to double check your solution.<br>I can see you are really thinking about this one...<br>I love the way you made a model of the problem |

## Kindergarten: Summary Table

| What Students Learn | What It Looks Like in Class | How Families Can Support at Home |
|---|---|---|
| Know number names 0-19 and count to 100. | Students practice counting through routines, songs, and games, connecting spoken numbers to written numerals. | Count stairs, toys, or snacks together; sing counting songs and practice number names during daily routines. |
| Count to tell the number of objects. | Children count real objects, point to each item, and check that their last count matches the total. | Invite your child to count forks at the table or blocks during play; ask, 'How many altogether?' |
| Compare numbers | Students use counters and pictures to compare sets and discuss which has more/fewer or the same. | Play 'Who has more?' with snacks or toy sets; talk about equal amounts too. |
| Understand addition and subtraction - fluency within 5, practice within 10. | Children act out story problems with objects, drawings, or fingers and explain their thinking. | Tell mini stories like 'We had 3 apples and I ate 1—how many left?' Use small objects to show it. |
| **Kindergarten Math Fluencies:**<br>● Add and subtract mentally within 5<br>● Count to 100<br>● Identify and write numbers 0-19 | | |

*This guide is intended to be an overview of the major work of each grade, as well as general guidance for how to support your child develop a growth mindset and become a confident math thinker. For more specific resources about what your child is learning in math, and how you can support them at home, please reach out to your child's school for family-facing curricular material.*

## Kindergarten: Know number names and the count sequence

### What Students Learn

Children learn to say number names in order and begin to count forward and backward. Students read and write numbers 0-19.

### What It Looks Like in Class

Students practice counting through routines, songs, and games, connecting spoken numbers to written numerals.

### How Families Can Support at Home

Count stairs, toys, or snacks together; sing counting songs and practice number names during daily routines.

## Kindergarten: Count to tell the number of objects

### What Students Learn

Students match numbers to groups of objects, showing that each number name represents one item (one-to-one).

### What It Looks Like in Class

Children count real objects, point to each item, and check that their last count matches the total.

### How Families Can Support at Home

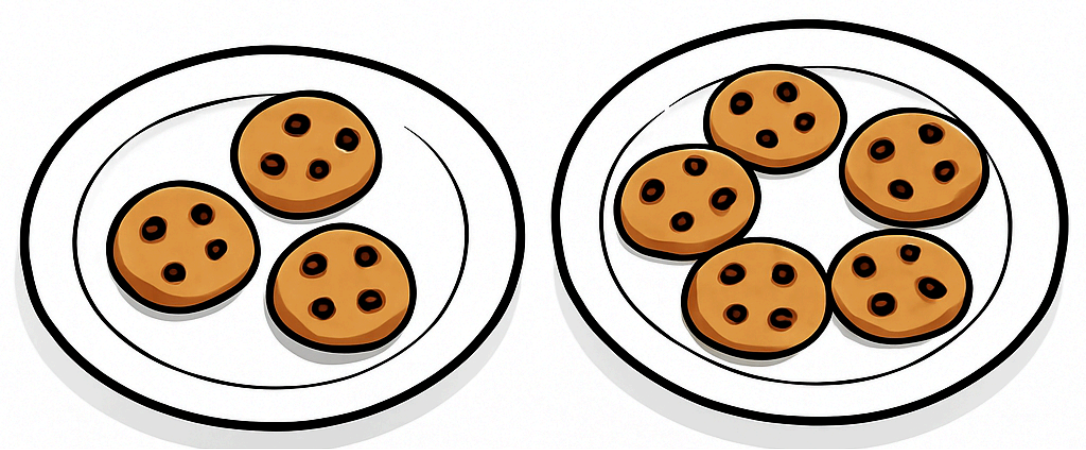
Invite your child to count forks at the table or blocks during play; ask, “How many?”. Model counting to tell how many. If your child is having difficulty counting objects, model “touch and move” to keep track of counting.

Write numbers 0-19 inside of cupcake papers - have your child place the number of small objects (ie beans, goldfish crackers, or craft pompoms) inside the cupcake paper.

## Kindergarten: Compare numbers

### What Students Learn
Children compare groups and numbers to decide more, less, or equal.

### What It Looks Like in Class
Students use counters and pictures to compare sets and discuss which has more/fewer or the same.



### How Families Can Support at Home
Play 'Who has more?' with snacks or toy sets; talk about equal amounts too.

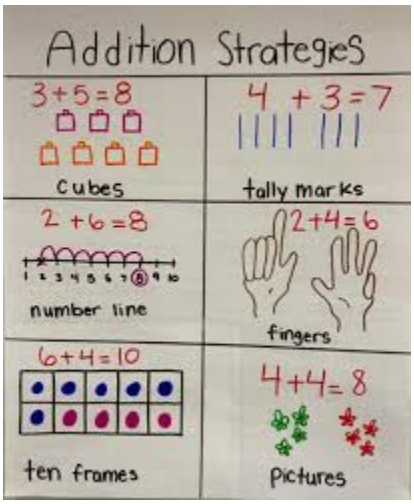
Play “war” with playing cards.

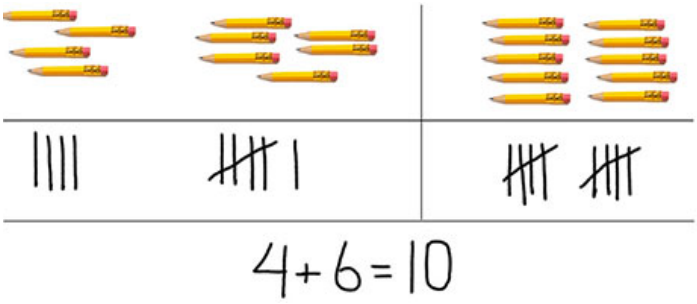
Play dice-rolling games - roll one die and ask “How many? How do you know?”

## Kindergarten: Understand addition and subtraction

### What Students Learn
Students solve early addition and subtraction situations by putting together / taking apart.

### What It Looks Like in Class
Children act out story problems with objects, drawings, or fingers and explain their thinking.





### How Families Can Support at Home
Tell mini stories like 'We had 3 apples and I ate 1. How many are left?' Use small objects or pictures to show it.

## Grade 1: Summary Table

| What Students Learn | What It Looks Like in Class | How Families Can Support at Home |
|---|---|---|
| Represent and solve problems involving addition and subtraction | Students use drawings, objects, and equations (with unknowns in any position) to show their thinking.<br><br>Students use doubles, near-doubles, making 10, and counting on to solve quickly and accurately. | Ask everyday story problems like 'We had 5 apples and bought 3—how many now?' Encourage drawings or counters.<br><br>Play fast fact games with dice/cards; hunt for pairs that make 10; celebrate strategy use. |
| Build Place value understanding | Students build their understanding of place value and use place-value understanding to add and subtract. | Practice decomposing 2-digit numbers into tens and ones. |
| **First Grade Math Fluencies**<br>● Add and subtract mentally within 10<br>● Count to 120<br>● Identify and write numbers 0-99 | | |

*This guide is intended to be an overview of the major work of each grade, as well as general guidance for how to support your child develop a growth mindset and become a confident math thinker. For more specific resources about what your child is learning in math, and how you can support them at home, please reach out to your child's school for family-facing curricular material.*

## Grade 1: Addition and Subtraction

### What Students Learn

Students use commutative/associative ideas and see subtraction as the inverse of addition.

Students use their understanding of place value to add multiples of 10 to a 2-digit number (ie 42 + 30), and solve 1 digit + 2-digit addition problems (ie 27 + 6)..

### What It Looks Like in Class

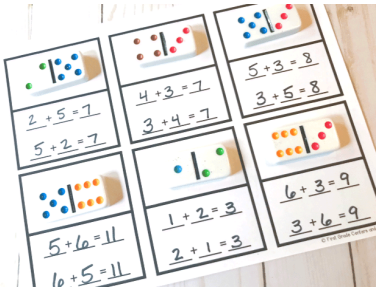
Children show that 3 + 5 = 5 + 3 and that if 8 − 5 = 3 then 8 − 3 = 5.

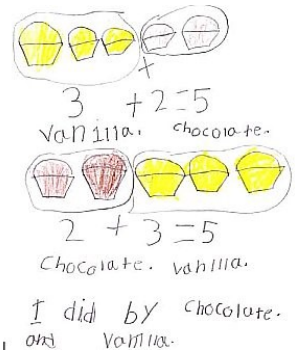
Students build fluency for math facts within 20.

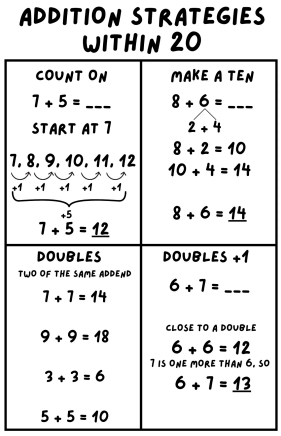
Students use strategies such as counting on by ones to solve problems like 27 + 6 (2"27, 28, 29, 30, 31, 32, 33")

Students use strategies such as counting on by tens to solve problems like 42 + 30 ("42, 52, 62, 72")

Students use doubles, near-doubles, making 10, and counting on to solve quickly and accurately.







### How Families Can Support at Home

Use dice or dominoes to practice turn-around facts and fact families.

Play fast fact games with dice/cards

Choose a target number (10-20) Take a deck of playing cards, and remove all of the face cards. Place 12 cards face-up in a grid pattern. Hunt for pairs (or 3 cards) of cards that make the target number, and take the pairs (replace the pair with new cards from the deck). You can take turns or play it as a race. You can make aces wild cards.

Practice doubles facts using a deck of cards by flipping the top card over and trying to figure out the double. You can play this by taking turns or making it a race. Leave the face cards in the deck as bonuses - whoever turns over a face card gets to keep it and turn over the next card.

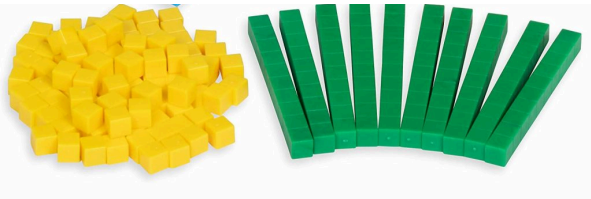
## Grade 1: Continue to build Place-Value Understanding

### What Students Learn

- Students learn that two-digit numbers are composed of tens and ones.
- Students read, write, and count numbers up to 120.
- Students use place-value to add larger numbers.

### What It Looks Like in Class

Students break apart two digit numbers into tens and ones. Students use math tools like base-ten blocks connecting cubes to model building and decomposing two-digit numbers into tens and ones. Students learn how to add a multiple of ten to a two digit number and to add a one-digit number to any two-digit number.



### How Families Can Support at Home

- Practice skip-counting by tens.
- Practice counting on from a number by tens (eg. 27, 37, 47, 57…)
- Practice counting on from a number by ones (eg. 47, 48, 49, 50, 51…)
- Practice decomposing numbers into tens and ones when you are out and about.
- Play place-value top-it: Use a deck of number cards. Each play draws 2 cards and tries to make the highest 2-digit number.

## Grade 2: Summary Table

| What Students Learn | What It Looks Like in Class | How Families Can Support at Home |
|---|---|---|
| Represent and solve problems involving addition and subtraction within 100.<br><br>Relate addition and subtraction to length<br><br>Use place value & properties to add and subtract | Students choose models (drawings, number lines, base-10 blocks) and write equations to represent problems. | Pose home problems like '7 toy cars and 3 more—how many now?' Invite drawings or acting it out.<br><br>Use coins/LEGOs/cereal pieces to make tens and ones; ask to show the same number another way. |
| Understand place value | Children use bundles and place value charts to show numbers in different ways. | Use coins/LEGOs/cereal pieces to make tens and ones; ask to show the same number another way. |
| **Second Grade Math Fluencies:**<br>● Add and subtract with efficiency and flexibility within 20<br>● Identify and write numbers 0-999 | | |

*This guide is intended to be an overview of the major work of each grade, as well as general guidance for how to support your child develop a growth mindset and become a confident math thinker. For more specific resources about what your child is learning in math, and how you can support them at home, please reach out to your child's school for family-facing curricular material.*

## Grade 2: Represent and solve problems involving addition and subtraction

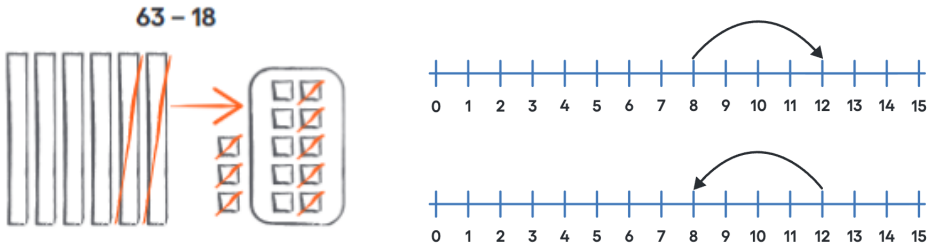
### What Students Learn

- Children solve one- and two-step story problems with addition and subtraction, within 100, with fluency within 20.
- Children solves addition and subtraction problems involving standard units of length (eg centimeters or inches)
- Children solve addition/subtraction problems in measurement contexts.
- Children use place-value strategies to add and subtract.

### What It Looks Like in Class

Children use strategies (count on, make 10, doubles) and explain how they know their answer is reasonable.

Students choose models (drawings, number lines, base-10 blocks) and write equations to represent problems.



### How Families Can Support at Home

Pose home problems like “We have 27 toy cars and we get 16 more. How many do we have now?”

Practice using drawings, small objects, or acting it out.

Practice writing an equation to represent the math of the problem.

## Grade 2: Continue to build place value understanding

### What Students Learn

Students understand hundreds, tens, and ones and compare/compose/decompose three-digit numbers.

### What It Looks Like in Class

Children use base-10 blocks and place value charts to show numbers in different ways.

### How Families Can Support at Home

Use coins/LEGOs/cereal pieces to make tens and ones; ask to show the same number another way.

## Grade 3 Summary Table

| What Students Learn | What It Looks Like in Class | How Families Can Support at Home |
|---|---|---|
| Represent and solve problems involving multiplication and division. | Students write equations with symbols for unknowns and use bar models/arrays to reason. Children rearrange/ compose facts and use known facts to derive unknowns. | Ask, '4 bags with 6 apples each—how many apples total?' Discuss different strategies such as modeling with an array or objects, and solve together. |
| Multiply and divide within 100 | Students practice patterns, skip-counting, and strategy-based fact fluency. | Use flash cards, skip-counting songs, or 'times bingo' to practice facts. |
| Use place value to perform multi-digit arithmetic | Children use expanded form, regrouping, and estimation to solve and check. | Have your child add receipts or compute change; compare mental vs. written methods. |
| Develop understanding of fractions as numbers | Students use models and number lines to represent unit fractions and builds of them. | Cut food into equal parts and name the fractions; place them on a simple line. |
| **Third Grade Math Fluencies**<br>● Single-digit multiplication | | |

*This guide is intended to be an overview of the major work of each grade, as well as general guidance for how to support your child develop a growth mindset and become a confident math thinker. For more specific resources about what your child is learning in math, and how you can support them at home, please reach out to your child's school for family-facing curricular material.*

## Grade 3: Represent and solve problems involving multiplication and division

### What Students Learn

Children solve problems with equal groups, arrays, and comparison situations.

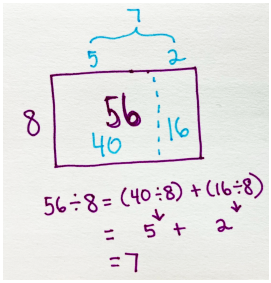
Students use properties (commutative, associative, distributive) and see division as inverse of multiplication.

Students learn that area can be measured in square units and that you can use find area by tiling an area with square unit tiles or using multiplication.

### What It Looks Like in Class

Students write equations with symbols for unknowns and use bar models/arrays to reason.

Children rearrange/compose facts and use known facts to derive unknowns.



***A note about multiplication arrays:***
*Students learn that multiplication means "groups of", and one way to model this is using arrays to show rows of objects. They learn arrays can be described as ___ rows of ___ , and that this can be expressed using multiplication as ____ x ____. This array of toy cars is described as 3 rows of 4 cars, or 3 x 4.*

### How Families Can Support at Home

Practice single-digit multiplication facts.

Take your child to the grocery store. Look at how things are packaged and make up multiplication problems about them:

Example: The yogurt cups come as a 6-pack. How many would we have if we bought 3 packs?

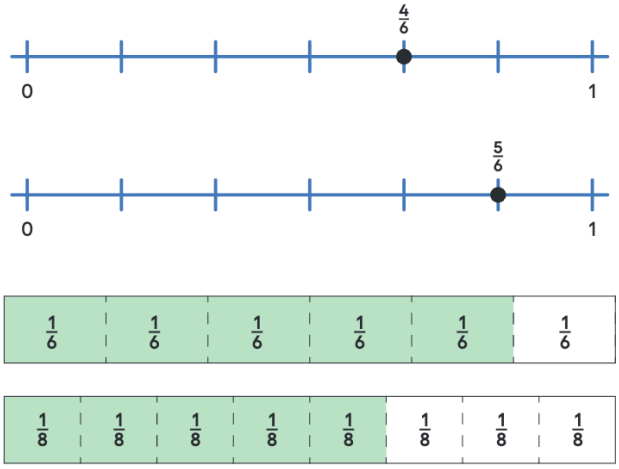
## Grade 3: Develop understanding of fractions as numbers

### What Students Learn

Children understand fractions as numbers on the number line and compare fractions with the same numerator/denominator.

### What It Looks Like in Class

Students use models and number lines to represent fractions.



### How Families Can Support at Home

Cut food into equal parts and name the fractions.

Do baking projects involving measuring fractions.

## Grade 4 Summary Table

| What Students Learn | What It Looks Like in Class | How Families Can Support at Home |
|---|---|---|
| Students multiply 2-digit by 2-digit numbers, and divide up to 4-digit numbers by single-digit numbers. | Students use equations with a letter for the unknown and assess reasonableness with estimation.<br><br>Students use visual models and models based on place-value to multiply and divide. | Pose multi-step problems from daily life; ask your child to estimate first and explain their steps.<br><br>Be open to learning new strategies for multiplying and dividing! |
| Fractions<br>● Find equivalent fractions<br>● Add and subtract fractions with like denominators. | Children use visual models and common benchmarks (0, 1/2, 1) to compare fractions and find equivalent fraction. Students use visual models and fraction strips to add and subtract fractions with the same denominator. | Use fraction strips to show equivalence and order; discuss which is closer to 1/2 or 1. Cook together and add fractional amounts; talk about 'how much more' is needed. |
| Understand decimal notation for fractions (tenth and hundredths) & compare decimals. | Children connect fractions, decimals, and money to reason about size. | Compare prices like $3.25 vs $3.52; place decimals on a number line. |

## Grade 4: Solve Problems with Whole Numbers

### What Students Learn

Students use equations with a letter for the unknown and assess reasonableness with estimation.

Children add/subtract fluently and multiply/divide multi-digit numbers using place-value strategies and algorithms.

**Multiplication**

Students use place-value strategies to solve multidigit multiplication, including:

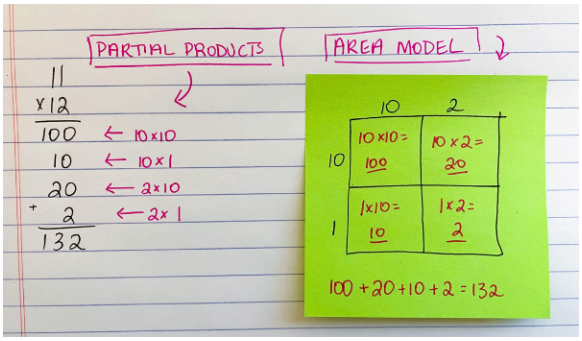
- 4-digit times 1-digits numbers (ie 3,238 x 7)
- 2-digit times 2-digit numbers (ie 42 x 18)

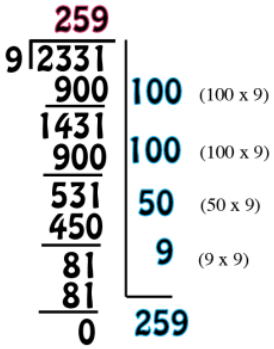
**Division**

Students use place-value strategies to solve multidigit division, including:

- 4-digit numbers divided by 1-digit numbers.
- Interpreting what the remainder means in the context of word problems.

### What It Looks Like in Class





### How Families Can Support at Home

Pose multi-step problems from daily life; ask your child to estimate first and explain their steps. Be open to learning new strategies for multiplying and dividing!

## Grade 4: Fractions and Decimals

### What Students Learn

Students generate equivalent fractions and compare fractions with different numerators/denominators.

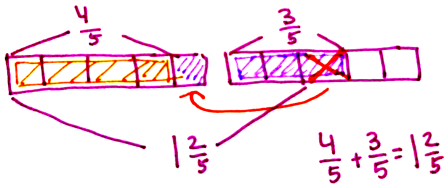
Children add/subtract fractions with denominators, decompose fractions, and solve word problems with fractions.

Students multiply fraction by whole numbers.

Students express tenths/hundredths as decimals and compare decimals to hundredths.

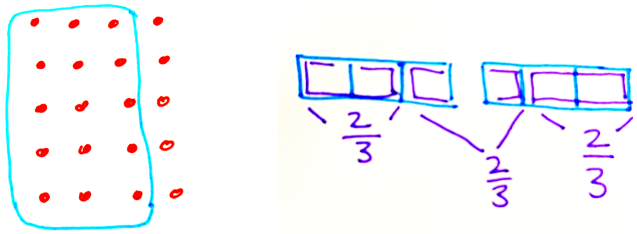
### What It Looks Like in Class

Children use visual models and common benchmarks (0, 1/2, 1) to compare. Students use area/number line models and mixed numbers to reason.Children connect fractions, decimals, and money to reason about size.
Students use visual models and fraction strips to add and subtract fracts with lie denominators.



Students learn that fractions of a group (ie ¾ of a class of 20 students) can be expressed as fraction multiplication (¾ x 20), and they represent and solve this using objects or pictures.

Students learn that repeated addition of a fraction can be expressed as whole number  x fraction multiplication (⅔ + ⅔ + ⅔ = 3 x ⅔), and they use visual models and fraction strips to represent and solve.



### How Families Can Support at Home

Use fraction strips to show equivalence and order; discuss which is closer to 1/2 or 1.

Do baking projects involving fractional measurements, and scale them up.

Take your child to the grocery storage and compare prices like $3.25 vs $3.52; place decimals on a number line.

## Grade 5 Summary Table

| What Students Learn | What It Looks Like in Class | How Families Can Support at Home |
|---|---|---|
| Decimals:<br>Students add and subtract decimals.<br>Students begin to multiply and divide decimals. | Students read/write/compare and round decimals to the thousandths.<br><br>Children estimate first, compute, and assess reasonableness of results. | Compare decimal prices; talk about which is greater and how you know. |
| Students add and subtract fractions and mixed numbers with unlike denominators.<br>Students begin to multiply and divide fractions. | Children use area models, number lines, and reasoning about size to check answers. | Bake with measuring cups; discuss equal amounts and combining fractions.<br><br>Scale recipes up or down using doubling/halving; ask if the result makes sense compared to the original amount. |
| Understand concepts of volume | Students find the volume of right rectangular prisms and solve real-world problems. | Build box shapes and measure volume; compare which box holds more and why. |
| Multi-digit multiplication and division | Students multiply multi-digit numbers and begin to use the standard algorithm for multi-digit multiplication.<br><br>Students divide 4-digit numbers by 2-digit numbers. | Practice rounding and estimating.<br>Be open to learning new ways to multiply and divide so that you can support your child. |

*This guide is intended to be an overview of the major work of each grade, as well as general guidance for how to support your child develop a growth mindset and become a confident math thinker. For more specific resources about what your child is learning in math, and how you can support them at home, please reach out to your child's school for family-facing curricular material.*

## Grade 5: Decimals

### What Students Learn

Children extend place value understanding of decimals to thousandths, and solve addition, subtraction, multiplication, and division problems with decimals:

| | |
|---|---|
| **Read, write, compare, and round**<br>Students read, write, and compare decimals to thousandths.<br><br>Students use rounding to generate estimates for decimal operations. | **Add/subtract**<br>Students add and subtract decimals to hundredths. |
| **Multiply**<br>Students multiply decimals to hundredths using strategies based on place-value. | **Divide**<br>Students divide decimals to hundredths using strategies based on place-value. |

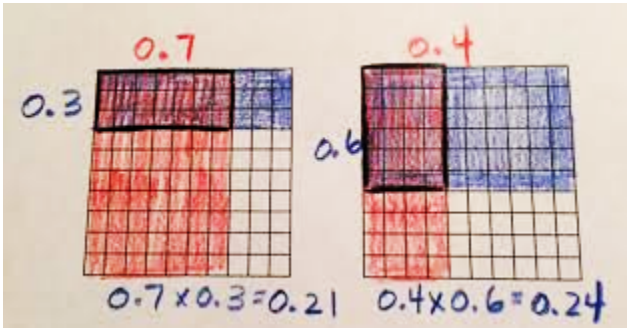
### What It Looks Like in Class

Students read/write/compare decimals and reason about magnitude and rounding.

Children estimate first, compute, and assess reasonableness of results.

Students use hundreds grids and place-value blocks to model decimal multiplication.

Students place decimals on a number line.



### How Families Can Support at Home

Compare decimal prices; talk about which is greater and how you know.

## Grade 5: Fractions

### Fractions

| | |
|---|---|
| **Add/subtract**<br>Students use equivalent-fraction strategies to add and subtract fractions and mixed numbers. | **Multiply and divide**<br>Students learn how to multiply fractions, and start to build an understanding of fraction division. |

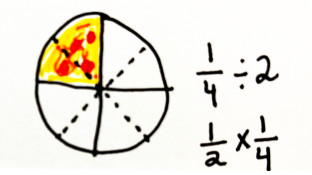
### What It Looks Like in Class

Students create equivalent fractions and reason with visual models in order to add and subtract fractions and mixed numbers with unlike denominators.

Students learn that when you multiply a fraction by another fraction, you get a fraction that is even smaller, and they use language like *a piece of a piece* to describe this. Students model this with pictures and connecting it to real-world context (ie ½ of ¼ of a pizza).

Students that fraction multiplication can also be expressed as division (ie ½ x ¼ can be expressed as ¼ ÷ 2.

Students explore fraction division with whole numbers divided by unit fractions (5 ÷ ¼) and unit fractions divided by whole numbers (¼ ÷ 2). Students model fraction division using pictures and tape diagrams.



*This diagram of a piece of pizza being split in half can represent either 1/2 x ¼ or ¼ ÷ 2*

### How Families Can Support at Home

Bake with measuring cups; discuss equal amounts and combining fractions.

Use recipes to double/halve; ask if the result makes sense compared to the original amount.

## Grade 5: Understand concepts of volume

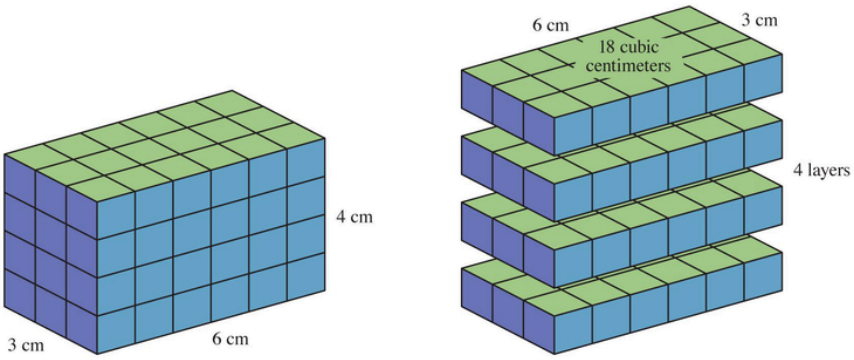
### What Students Learn

Children understand volume as packing with unit cubes and relate volume to multiplication and addition.

### What It Looks Like in Class

Students find the volume of right rectangular prisms and solve real-world problems.

Students learn that you can find volume by stacking layers cubes, and then they learn that you can use the volume formula (length x width x height or base x height) to find the volume.



### How Families Can Support at Home

Build box shapes and measure volume; compare which box holds more and why.

Practice counting the number of cubes in a rectangular prism diagram, when some of the cubes are obscured.

Play with Legos together - talk about how many bricks you need to fill in empty space.

## Grade 5: Multi-digit multiplication and division

### What Students Learn

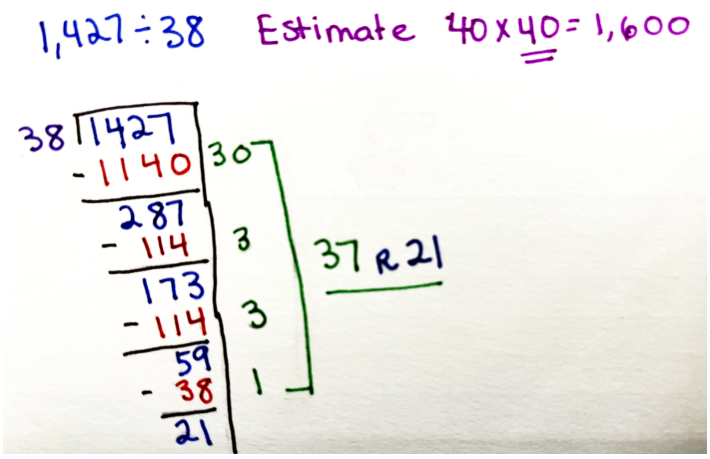
Students extend their understanding of multiplication and division to solve more complex equations.

### Multiplication

In 5th grade, students begin to transition to using the standard algorithm for multi-digit multiplication, connecting it to the area models and partial-product models.

### Division

In 5th grade, students learn how to divide larger numbers - up to 4-digits divided by up to 2-digits. Students use visual models and place-value strategies. Note: While some students may know and use “long-division” as a strategy, this is not a grade-level expectation in 5th grade, and using a more conceptual strategy like partial-quotients can result in a more solid understanding.



### How Families Can Support at Home

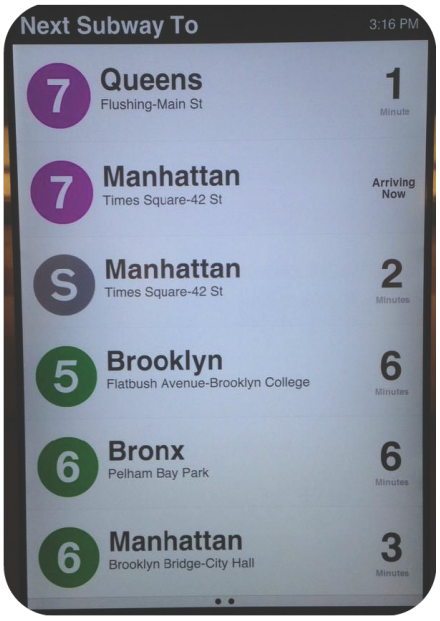
Talk to your child about how partial products and the standard algorithm are related.

Practice rounding and estimating (ie this roll of paper towels has 120 sheets. If we use about 4 sheets per day, it should last us about 30 days)

# Math in Our World

We are doing math ALL the time! You can build your child's understanding of math concepts by helping them to make connections to the math that exists all around us!

- Grocery shopping
- Setting the table, sorting and putting away flatware,
- Counting down with the "walk" sign.
- Sorting objects



# Mathematical Questions

*Talking to your child about  math in the world around us can help them to make connections to what they are learning and build their language skills. Here are a few examples of mathematical questions you can ask your child:*

How many are there?

Can you count _____?

How many more do you have? How many less?

Do you see a pattern?

Can you sort? Then count and compare (shapes, toys, etc).

I wonder how many _____?

How are _____ the same and different?

Is this symmetrical? How do you know?

How would you describe this shape?

# Math Games

*Games are great way to build and practice foundational skills in a way that is fun and social. Many games also build problem-solving and strategizing skills. Here are a few of our favorites.*

| Game | Skills |
|---|---|
| Sorry   | Counting, addition, one-to-one correspondence, strategizing. |
| Proof!   | Addition, subtraction, multiplication, division |
| War   | Number identification, comparing, can be adapted to any operation |
| Yahtzee   | Counting, subitizing, addition |
| Set   | Set theory, identifying and describing attributes |
| Prime Climb  | Addition, subtraction, multiplication, division, factorization |

## Building Conceptual Understanding - A Progression of Modeling

As students build their understanding of the mathematical concepts in school, they progress from modeling their thinking from concrete to representational to abstract. Beginning by connecting ideas to real objects and experiences helps children to attach meaning to the new understanding that they are building, and to connect new ideas to what they already know.

**Concrete**: Students use actual objects such as math manipulatives (counters, base-ten blocks, connecting cubes) to model their thinking.

**Representational:** Students draw pictures and diagrams to model their ideas. Students may use tallies, tape diagrams, or place value charts to do this.

**Abstract:** Students use mathematics expressions and equations to model their thinking.
