Air Quality and Greenhouse Gas Background and Modeling Data

AIR QUALITY

Climate/Meteorology

SOUTH COAST AIR BASIN

The project site lies within the South Coast Air Basin (SoCAB), which includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. The SoCAB is in a coastal plain with connecting broad valleys and low hills and is bounded by the Pacific Ocean in the southwest quadrant, with high mountains forming the remainder of the perimeter. The general region lies in the semi-permanent high-pressure zone of the eastern Pacific. As a result, the climate is mild, tempered by cool sea breezes. This usually mild weather pattern is interrupted infrequently by periods of extremely hot weather, winter storms, and Santa Ana winds (SCAQMD 2005).

Temperature and Precipitation

The annual average temperature varies little throughout the SoCAB, ranging from the low to middle 60s, measured in degrees Fahrenheit (°F). With a more pronounced oceanic influence, coastal areas show less variability in annual minimum and maximum temperatures than inland areas. The climatological station nearest to the project site is the San Fernando Monitoring Station (ID No. 047759). The average low is reported at 42.9°F in December, and the average high is 92.4°F in August (WRCC 2017).

In contrast to a very steady pattern of temperature, rainfall is seasonally and annually highly variable. Almost all rain falls from November through April. Summer rainfall is normally restricted to widely scattered thundershowers near the coast, with slightly heavier shower activity in the east and over the mountains. The historical rainfall average for the project area is 17.66 inches per year (WRCC 2017).

Humidity

Although the SoCAB has a semiarid climate, the air near the earth's surface is typically moist because of the presence of a shallow marine layer. Except for infrequent periods when dry, continental air is brought into the SoCAB by offshore winds, the "ocean effect" is dominant. Periods of heavy fog, especially along the coast, are frequent. Low clouds, often referred to as high fog, are a characteristic climatic feature. Annual average humidity is 70 percent at the coast and 57 percent in the eastern portions of the SoCAB (SCAQMD 2005).

Wind

Wind patterns across the south coastal region are characterized by westerly or southwesterly onshore winds during the day and by easterly or northeasterly breezes at night. Wind speed is somewhat greater during the dry summer months than during the rainy winter season.

Between periods of wind, periods of air stagnation may occur, both in the morning and evening hours. Air stagnation is one of the critical determinants of air quality conditions on any given day. During the winter and fall months, surface high-pressure systems over the SoCAB, combined with other meteorological conditions, can result in very strong, downslope Santa Ana winds. These winds normally continue a few days before predominant meteorological conditions are reestablished.

The mountain ranges to the east affect the transport and diffusion of pollutants by inhibiting their eastward transport. Air quality in the SoCAB generally ranges from fair to poor and is similar to air quality in most of coastal southern California. The entire region experiences heavy concentrations of air pollutants during prolonged periods of stable atmospheric conditions (SCAQMD 2005).

Inversions

In conjunction with the two characteristic wind patterns that affect the rate and orientation of horizontal pollutant transport, there are two similarly distinct types of temperature inversions that control the vertical depth through which pollutants are mixed. These are the marine/subsidence inversion and the radiation inversion. The combination of winds and inversions are critical determinants in leading to the highly degraded air quality in summer and the generally good air quality in the winter in the project area (SCAQMD 2005).

Air Quality Regulations

The proposed project has the potential to release gaseous emissions of criteria pollutants and dust into the ambient air; therefore, it falls under the ambient air quality standards promulgated at the local, state, and federal levels. The project site is in the SoCAB and is subject to the rules and regulations imposed by the South Coast Air Quality Management District (SCAQMD). However, SCAQMD reports to California Air Resources board (CARB), and all criteria emissions are also governed by the California and national Ambient Air Quality Standards (AAQS). Federal, state, regional, and local laws, regulations, plans, or guidelines that are potentially applicable to the proposed project are summarized below.

AMBIENT AIR QUALITY STANDARDS

The Clean Air Act (CAA) was passed in 1963 by the US Congress and has been amended several times. The 1970 Clean Air Act amendments strengthened previous legislation and laid the foundation for the regulatory scheme of the 1970s and 1980s. In 1977, Congress again added several provisions, including nonattainment requirements for areas not meeting National AAQS and the Prevention of Significant Deterioration program. The 1990 amendments represent the latest in a series of federal efforts to regulate the protection of air quality in the United States. The CAA allows states to adopt more stringent standards or to include other pollution species. The California Clean Air Act (CCAA), signed into law in 1988, requires all areas of the state

to achieve and maintain the California AAQS by the earliest practical date. The California AAQS tend to be more restrictive than the National AAQS, based on even greater health and welfare concerns.

These National AAQS and California AAQS are the levels of air quality considered to provide a margin of safety in the protection of the public health and welfare. They are designed to protect "sensitive receptors" most susceptible to further respiratory distress, such as asthmatics, the elderly, very young children, people already weakened by other disease or illness, and persons engaged in strenuous work or exercise. Healthy adults can tolerate occasional exposure to air pollutant concentrations considerably above these minimum standards before adverse effects are observed.

Both California and the federal government have established health-based AAQS for seven air pollutants. As shown in Table 1, *Ambient Air Quality Standards for Criteria Pollutants*, these pollutants include ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), coarse inhalable particulate matter (PM_{10}), fine inhalable particulate matter ($PM_{2.5}$), and lead (Pb). In addition, the state has set standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. These standards are designed to protect the health and welfare of the populace with a reasonable margin of safety.

Table 1 Ambient Air Quality Standards for Criteria Pollutants

Pollutant	Averaging Time	California Standard[1]	Federal Primary Standard[2]	Major Pollutant Sources
Ozone (O_3)[3]	1 hour	0.09 ppm	*	Motor vehicles, paints, coatings, and solvents.
	8 hours	0.070 ppm	0.070 ppm	
Carbon Monoxide (CO)	1 hour	20 ppm	35 ppm	Internal combustion engines, primarily gasoline-powered motor vehicles.
	8 hours	9.0 ppm	9 ppm	
Nitrogen Dioxide (NO_2)	Annual Arithmetic Mean	0.030 ppm	0.053 ppm	Motor vehicles, petroleum-refining operations, industrial sources, aircraft, ships, and railroads.
	1 hour	0.18 ppm	0.100 ppm	
Sulfur Dioxide (SO_2)	Annual Arithmetic Mean	*	0.030 ppm	Fuel combustion, chemical plants, sulfur recovery plants, and metal processing.
	1 hour	0.25 ppm	0.075 ppm	
	24 hours	0.04 ppm	0.14 ppm	
Respirable Coarse Particulate Matter (PM_{10})	Annual Arithmetic Mean	20 µg/m^3	*	Dust and fume-producing construction, industrial, and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g., wind-raised dust and ocean sprays).
	24 hours	50 µg/m^3	150 µg/m^3	
Respirable Fine Particulate Matter ($PM_{2.5}$)[4]	Annual Arithmetic Mean	12 µg/m^3	12 µg/m^3	Dust and fume-producing construction, industrial, and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g., wind-raised dust and ocean sprays).
	24 hours	*	35 µg/m^3	

Table 1 Ambient Air Quality Standards for Criteria Pollutants

Pollutant	Averaging Time	California Standard[1]	Federal Primary Standard[2]	Major Pollutant Sources
Lead (Pb)	30-Day Average	1.5 µg/m^3	*	Present source: lead smelters, battery manufacturing & recycling facilities. Past source: combustion of leaded gasoline.
	Calendar Quarter	*	1.5 µg/m^3	
	Rolling 3-Month Average	*	0.15 µg/m^3	
Sulfates (SO_4)[5]	24 hours	25 µg/m^3	*	Industrial processes.
Visibility Reducing Particles	8 hours	ExCo =0.23/km visibility of 10≥ miles	No Federal Standard	Visibility-reducing particles consist of suspended particulate matter, which is a complex mixture of tiny particles that consists of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. These particles vary greatly in shape, size and chemical composition, and can be made up of many different materials such as metals, soot, soil, dust, and salt.
Hydrogen Sulfide	1 hour	0.03 ppm	No Federal Standard	Hydrogen sulfide (H_2S) is a colorless gas with the odor of rotten eggs. It is formed during bacterial decomposition of sulfur-containing organic substances. Also, it can be present in sewer gas and some natural gas, and can be emitted as the result of geothermal energy exploitation.
Vinyl Chloride	24 hour	0.01 ppm	No Federal Standard	Vinyl chloride (chloroethene), a chlorinated hydrocarbon, is a colorless gas with a mild, sweet odor. Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products. Vinyl chloride has been detected near landfills, sewage plants, and hazardous waste sites, due to microbial breakdown of chlorinated solvents.

Source: CARB 2016a.

Notes: ppm: parts per million; µg/m^3: micrograms per cubic meter

* Standard has not been established for this pollutant/duration by this entity.

1 California standards for O_3, CO (except 8-hour Lake Tahoe), SO_2 (1 and 24 hour), NO_2, and particulate matter (PM_{10}, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2 National standards (other than O_3, PM, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The O_3 standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m^3 is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.

3 On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

4 On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m^3 to 12.0 µg/m^3. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m^3, as was the annual secondary standard of 15 µg/m^3. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m^3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

5 On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. The 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

California has also adopted a host of other regulations that reduce criteria pollutant emissions, including:

- AB 1493: Pavley Fuel Efficiency Standards
- Title 20 California Code of Regulations (CCR): Appliance Energy Efficiency Standards
- Title 24, Part 6, CCR: Building and Energy Efficiency Standards
- Title 24, Part 11, CCR: Green Building Standards Code

CRITERIA AIR POLLUTANTS

The air pollutants emitted into the ambient air by stationary and mobile sources are regulated by federal and state law. Air pollutants are categorized as primary or secondary pollutants. Primary air pollutants are those that are emitted directly from sources. Carbon monoxide (CO), volatile organic compounds (VOC), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), coarse inhalable particulate matter (PM_{10}), fine inhalable particulate matter ($PM_{2.5}$), and lead (Pb) are primary air pollutants. Of these, CO, SO_2, NO_2, PM_{10}, and $PM_{2.5}$ are "criteria air pollutants," which means that ambient air quality standards (AAQS) have been established for them. VOC and oxides of nitrogen (NO_x) are air pollutant precursors that form secondary criteria pollutants through chemical and photochemical reactions in the atmosphere. Ozone (O_3) and NO_2 are the principal secondary pollutants. A description of each of the primary and secondary criteria air pollutants and their known health effects is presented below.

Carbon Monoxide (CO) is a colorless, odorless, toxic gas produced by incomplete combustion of carbon substances, such as gasoline or diesel fuel. CO is a primary criteria air pollutant. CO concentrations tend to be the highest during winter mornings with little to no wind, when surface-based inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion, engines and motor vehicles operating at slow speeds are the primary source of CO in the SoCAB. The highest ambient CO concentrations are generally found near traffic-congested corridors and intersections. The primary adverse health effect associated with CO is interference with normal oxygen transfer to the blood, which may result in tissue oxygen deprivation (SCAQMD 2005; USEPA 2017a). The SoCAB is designated under the California and National AAQS as being in attainment of CO criteria levels (CARB 2016b).

Volatile Organic Compounds (VOC) are compounds composed primarily of atoms of hydrogen and carbon. Internal combustion associated with motor vehicle usage is the major source of hydrocarbons. Other sources of VOCs include evaporative emissions associated with the use of paints and solvents, the application of asphalt paving, and the use of household consumer products such as aerosols. There are no ambient air quality standards established for VOCs. However, because they contribute to the formation of ozone (O_3), SCAQMD has established a significance threshold for this pollutant (SCAQMD 2005).

Nitrogen Oxides (NO_x) are a byproduct of fuel combustion and contribute to the formation of O_3, PM_{10}, and $PM_{2.5}$. The two major forms of NO_x are nitric oxide (NO) and nitrogen dioxide (NO_2). The principal form of NO_2 produced by combustion is NO, but NO reacts with oxygen to form NO_2, creating the mixture of NO and NO_2 commonly called NO_x. NO_2 acts as an acute irritant and, in equal concentrations, is more injurious than NO. At atmospheric concentrations, however, NO_2 is only potentially irritating. There is some indication of a relationship between NO_2 and chronic pulmonary fibrosis. Some increase in

bronchitis in children (two and three years old) has also been observed at concentrations below 0.3 part per million (ppm). NO_2 absorbs blue light; the result is a brownish-red cast to the atmosphere and reduced visibility. NO is a colorless, odorless gas formed from atmospheric nitrogen and oxygen when combustion takes place under high temperature and/or high pressure (SCAQMD 2005; USEPA 2017a). The SoCAB is designated as an attainment area for NO_2 under the National AAQS California AAQS (CARB 2016b).

Sulfur Dioxide (SO_2) is a colorless, pungent, irritating gas formed by the combustion of sulfurous fossil fuels. It enters the atmosphere as a result of burning high-sulfur-content fuel oils and coal and from chemical processes at chemical plants and refineries. Gasoline and natural gas have very low sulfur content and do not release significant quantities of SO_2 (SCAQMD 2005; USEPA 2017). When sulfur dioxide forms sulfates (SO_4) in the atmosphere, together these pollutants are referred to as sulfur oxides (SO_X). Thus, SO_2 is both a primary and secondary criteria air pollutant. At sufficiently high concentrations, SO_2 may irritate the upper respiratory tract. At lower concentrations and when combined with particulates, SO_2 may do greater harm by injuring lung tissue. The SoCAB is designated as attainment under the California and National AAQS (CARB 2016b).

Suspended Particulate Matter (PM_{10} and $PM_{2.5}$) consists of finely divided solids or liquids such as soot, dust, aerosols, fumes, and mists. Two forms of fine particulates are now recognized and regulated. Inhalable coarse particles, or PM_{10}, include the particulate matter with an aerodynamic diameter of 10 microns (i.e., 10 millionths of a meter or 0.0004 inch) or less. Inhalable fine particles, or $PM_{2.5}$, have an aerodynamic diameter of 2.5 microns (i.e., 2.5 millionths of a meter or 0.0001 inch) or less. Particulate discharge into the atmosphere results primarily from industrial, agricultural, construction, and transportation activities. However, wind action on arid landscapes also contributes substantially to local particulate loading (i.e., fugitive dust). Both PM_{10} and $PM_{2.5}$ may adversely affect the human respiratory system, especially in people who are naturally sensitive or susceptible to breathing problems (SCAQMD 2005).

The US Environmental Protection Agency's (EPA) scientific review concluded that $PM_{2.5}$, which penetrates deeply into the lungs, is more likely than PM_{10} to contribute to health effects and at concentrations that extend well below those allowed by the current PM_{10} standards. These health effects include premature death and increased hospital admissions and emergency room visits (primarily the elderly and individuals with cardiopulmonary disease); increased respiratory symptoms and disease (children and individuals with cardiopulmonary disease such as asthma); decreased lung functions (particularly in children and individuals with asthma); and alterations in lung tissue and structure and in respiratory tract defense mechanisms (SCAQMD 2005). There has been emerging evidence that even smaller particulates with an aerodynamic diameter of <0.1 microns or less (i.e., ≤ 0.1 millionths of a meter or <0.000004 inch), known as ultrafine particulates (UFPs), have human health implications, because UFPs toxic components may initiate or facilitate biological processes that may lead to adverse effects to the heart, lungs, and other organs (SCAQMD 2013). However, the EPA or CARB have yet to adopt AAQS to regulate these particulates. Diesel particulate matter (DPM) is classified by the CARB as a carcinogen (CARB 1998). Particulate matter can also cause environmental effects such as visibility impairment,[1] environmental damage,[2] and aesthetic damage[3]

[1] $PM_{2.5}$ is the main cause of reduced visibility (haze) in parts of the United States.

(SCAQMD 2005; USEPA 2017a). The SoCAB is a nonattainment area for $PM_{2.5}$ under California and National AAQS and a nonattainment area for PM_{10} under the California AAQS (CARB 2016b).[4]

Ozone (O_3) is commonly referred to as "smog" and is a gas that is formed when VOCs and NO_x, both by-products of internal combustion engine exhaust, undergo photochemical reactions in the presence of sunlight. O_3 is a secondary criteria air pollutant. O_3 concentrations are generally highest during the summer months when direct sunlight, light winds, and warm temperatures create favorable conditions for the formation of this pollutant. O_3 poses a health threat to those who already suffer from respiratory diseases as well as to healthy people. Breathing O_3 can trigger a variety of health problems, including chest pain, coughing, throat irritation, and congestion. It can worsen bronchitis, emphysema, and asthma. Ground-level O_3 also can reduce lung function and inflame the linings of the lungs. Repeated exposure may permanently scar lung tissue. O_3 also affects sensitive vegetation and ecosystems, including forests, parks, wildlife refuges, and wilderness areas. In particular, O_3 harms sensitive vegetation during the growing season (SCAQMD 2005; USEPA 2017a). The SoCAB is designated as extreme nonattainment under the California AAQS (1-hour and 8-hour) and National AAQS (8-hour) (CARB 2016b).

Lead (Pb) concentrations decades ago exceeded the state and federal AAQS by a wide margin, but have not exceeded state or federal air quality standards at any regular monitoring station since 1982 (SCAQMD 2005). However, in 2008 the EPA and CARB adopted more strict lead standards, and special monitoring sites immediately downwind of lead sources[5] recorded every localized violations of the new state and federal standards. As a result of these localized violations, the Los Angeles County portion of the SoCAB was designated in 2010 as nonattainment under the National AAQS for lead (SCAQMD 2012; CARB 2016b). The project is not characteristic of industrial-type projects that have the potential to emit lead. Therefore, lead is not a pollutant of concern for the project.

TOXIC AIR CONTAMINANTS

The public's exposure to air pollutants classified as toxic air contaminants (TACs) is a significant environmental health issue in California. In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health. The California Health and Safety Code defines a TAC as "an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health." A substance that is listed as a hazardous air pollutant (HAP) pursuant to Section 112(b) of the federal Clean

[2] Particulate matter can be carried over long distances by wind and then settle on ground or water, making lakes and streams acidic; changing the nutrient balance in coastal waters and large river basins; depleting the nutrients in soil; damaging sensitive forests and farm crops; and affecting the diversity of ecosystems.

[3] Particulate matter can stain and damage stone and other materials, including culturally important objects such as statues and monuments.

[4] CARB approved the SCAQMD's request to redesignate the SoCAB from serious nonattainment for PM_{10} to attainment for PM_{10} under the National AAQS on March 25, 2010, because the SoCAB has not violated federal 24-hour PM_{10} standards during the period from 2004 to 2007. In June 2013, the EPA approved the State of California's request to redesignate the PM_{10} nonattainment area to attainment of the PM_{10} National AAQS, effective on July 26, 2013.

[5] Source-oriented monitors record concentrations of lead at lead-related industrial facilities in the SoCAB, which include Exide Technologies in the City of Commerce; Quemetco, Inc., in the City of Industry; Trojan Battery Company in Santa Fe Springs; and Exide Technologies in Vernon. Monitoring conducted between 2004 through 2007 identified that the Trojan Battery Company and Exide Technologies exceed the federal standards (SCAQMD 2012).

Air Act (42 United States Code §7412[b]) is a toxic air contaminant. Under state law, the California Environmental Protection Agency (Cal/EPA), acting through CARB, is authorized to identify a substance as a TAC if it determines that the substance is an air pollutant that may cause or contribute to an increase in mortality or to an increase in serious illness, or may pose a present or potential hazard to human health.

California regulates TACs primarily through Assembly Bill (AB) 1807 (Tanner Air Toxics Act) and AB 2588 (Air Toxics "Hot Spot" Information and Assessment Act of 1987). The Tanner Air Toxics Act sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an "airborne toxics control measure" for sources that emit designated TACs. If there is a safe threshold for a substance (i.e., a point below which there is no toxic effect), the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology to minimize emissions. To date, CARB has established formal control measures for 11 TACs, all of which are identified as having no safe threshold.

Air toxics from stationary sources are also regulated in California under the Air Toxics "Hot Spot" Information and Assessment Act of 1987. Under AB 2588, toxic air contaminant emissions from individual facilities are quantified and prioritized by the air quality management district or air pollution control district. High priority facilities are required to perform a health risk assessment and, if specific thresholds are exceeded, are required to communicate the results to the public in the form of notices and public meetings.

By the last update to the TAC list in December 1999, CARB had designated 244 compounds as TACs (CARB 1999). Additionally, CARB has implemented control measures for a number of compounds that pose high risks and show potential for effective control. The majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from diesel-fueled engines.

In 1998, CARB identified particulate emissions from diesel-fueled engines (diesel PM) as a TAC. Previously, the individual chemical compounds in diesel exhaust were considered TACs. Almost all diesel exhaust particle mass is 10 microns or less in diameter. Because of their extremely small size, these particles can be inhaled and eventually trapped in the bronchial and alveolar regions of the lung.

CARB has promulgated the following specific rules to limit TAC emissions:

- 13 CCR Chapter 10, Section 2485, Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling
- 13 CCR Chapter 10, Section 2480, Airborne Toxic Control Measure to Limit School Bus Idling and Idling at Schools
- 13 CCR Section 2477 and Article 8, Airborne Toxic Control Measure for In-Use Diesel-Fueled Transport Refrigeration Units (TRU) and TRU Generator Sets and Facilities Where TRUs Operate

Multiple Airborne Toxics Exposure Study (MATES)

The Multiple Air Toxics Exposure Study (MATES) is a monitoring and evaluation study on ambient concentrations of TACs and estimated the potential health risks from air toxics in the SoCAB. In 2008, SCAQMD conducted its third update to the MATES study (MATES III). The results showed that the overall risk for excess cancer from a lifetime exposure to ambient levels of air toxics was about 1,200 in a million. The largest contributor to this risk was diesel exhaust, accounting for 84 percent of the cancer risk (SCAQMD 2008a).

SCAQMD recently released the fourth update (MATES IV). The results showed that the overall monitored risk for excess cancer from a lifetime exposure to ambient levels of air toxics decreased to approximately 418 in one million. Compared to the 2008 MATES III, monitored excess cancer risks decreased by approximately 65 percent. Approximately 90 percent of the risk is attributed to mobile sources while 10 percent is attributed to TACs from stationary sources, such as refineries, metal processing facilities, gas stations, and chrome plating facilities. The largest contributor to this risk was diesel exhaust, accounting for approximately 68 percent of the air toxics risk. Compared to MATES III, MATES IV found substantial improvement in air quality and associated decrease in air toxics exposure. As a result, the estimated basin-wide population-weighted risk decreased by approximately 57 percent compared to the analysis done for the MATES III time period (SCAQMD 2015a).

The Office of Environmental Health Hazard Assessment (OEHHA) updated the guidelines for estimating cancer risks on March 6, 2015. The new method utilizes higher estimates of cancer potency during early life exposures, which result in a higher calculation of risk. There are also differences in the assumptions on breathing rates and length of residential exposures. When combined together, SCAQMD estimates that risks for a given inhalation exposure level will be about 2.7 times higher using the proposed updated methods identified in MATES IV (e.g., 2.7 times higher than 418 in one million overall excess cancer risk) (SCAQMD 2015a).

Air Quality Management Planning

SCAQMD is the agency responsible for preparing the air quality management plan (AQMP) for the SoCAB in coordination with the Southern California Association of Governments (SCAG). Since 1979, a number of AQMPs have been prepared.

2016 AQMP

The 2016 AQMP addresses strategies and measures to attain the 2008 federal 8-hour ozone standard by 2031, the 2012 federal annual $PM_{2.5}$ standard by 2025, the 2006 federal 24-hour $PM_{2.5}$ standard by 2019, the 1997 federal 8-hour ozone standard by 2023, and the 1979 federal 1-hour ozone standard by year 2022. It is projected that total NO_X emissions in the SoCAB would need to be reduced to 150 tons per day (tpd) by year 2023 and to 100 tpd in year 2031 to meet the 1997 and 2008 federal 8-hour ozone standards. The strategy to meet the 1997 federal 8-hour ozone standard would also lead to attaining the 1979 federal 1-hour ozone standard by year 2022 (SCAQMD 2017), which requires reducing NO_X emissions in the SoCAB to 250 tpd. Reducing NO_X emissions would also reduce $PM_{2.5}$ concentrations within the SoCAB. However, as the goal is

to meet the 2012 federal annual $PM_{2.5}$ standard no later than year 2025, SCAQMD is seeking to reclassify the SoCAB from "moderate" to "serious" nonattainment under this federal standard. A "moderate" non-attainment would require meeting the 2012 federal standard by no later than 2021. Overall, the 2016 AQMP is composed of stationary and mobile-source emission reductions from regulatory control measures, incentive-based programs, co-benefits from climate programs, mobile-source strategies, and reductions from federal sources such as aircrafts, locomotives, and ocean-going vessels. Strategies outlined in the 2016 AQMP would be implemented in collaboration between CARB and the EPA (SCAQMD 2017). The 2016 AQMP was adopted by the Board on March 3, 2017.

LEAD STATE IMPLEMENTATION PLAN

In 2008 EPA designated the Los Angeles County portion of the SoCAB nonattainment under the federal lead (Pb) classification due to the addition of source-specific monitoring under the new federal regulation. This designation was based on two source-specific monitors in Vernon and the City of Industry exceeding the new standard. The rest of the SoCAB, outside the Los Angeles County nonattainment area remains in attainment of the new standard. On May 24, 2012, CARB approved the SIP revision for the federal lead standard, which the EPA revised in 2008. Lead concentrations in this nonattainment area have been below the level of the federal standard since December 2011. The SIP revision was submitted to EPA for approval.

AREA DESIGNATIONS

The AQMP provides the framework for air quality basins to achieve attainment of the state and federal ambient air quality standards through the State Implementation Plan (SIP). Areas are classified as attainment or nonattainment areas for particular pollutants, depending on whether they meet ambient air quality standards. Severity classifications for ozone nonattainment range in magnitude from marginal, moderate, and serious to severe and extreme.

- **Unclassified:** a pollutant is designated unclassified if the data are incomplete and do not support a designation of attainment or nonattainment.
- **Attainment:** a pollutant is in attainment if the CAAQS for that pollutant was not violated at any site in the area during a three-year period.
- **Nonattainment:** a pollutant is in nonattainment if there was at least one violation of a state AAQS for that pollutant in the area.
- **Nonattainment/Transitional:** a subcategory of the nonattainment designation. An area is designated nonattainment/transitional to signify that the area is close to attaining the AAQS for that pollutant.

The attainment status for the SoCAB is shown in Table 2, *Attainment Status of Criteria Pollutants in the South Coast Air Basin*. The SoCAB is designated in attainment of the California AAQS for sulfates. The SoCAB is designated as nonattainment for lead (Los Angeles County only) under the National AAQS.

Table 2 Attainment Status of Criteria Pollutants in the South Coast Air Basin

Pollutant	State	Federal
Ozone – 1-hour	Extreme Nonattainment	No Federal Standard
Ozone – 8-hour	Extreme Nonattainment	Extreme Nonattainment
PM_{10}	Serious Nonattainment	Attainment/Maintenance
$PM_{2.5}$	Nonattainment	Nonattainment[1]
CO	Attainment	Attainment
NO_2	Attainment	Attainment/Maintenance
SO_2	Attainment	Attainment
Lead	Attainment	Nonattainment (Los Angeles County only)[2]
All others	Attainment/Unclassified	Attainment/Unclassified

Source: CARB 2016b.

[1] SCAQMD is seeking to reclassify the SoCAB from "moderate" to "serious" nonattainment under federal $PM_{2.5}$ standard.

[2] In 2010, the Los Angeles portion of the SoCAB was designated nonattainment for lead under the new federal and existing state AAQS as a result of large industrial emitters. Remaining areas within the SoCAB are unclassified.

Existing Ambient Air Quality

Existing levels of ambient air quality and historical trends and projections in the vicinity of the project site are best documented by measurements taken by the SCAQMD. The project site is located within Source Receptor Area (SRA) 6 – West San Fernando Valley. The air quality monitoring station closest to the project site is the Reseda Monitoring Station. This station monitors O_3, CO, NO_2, and $PM_{2.5}$. Data for SO_2 and PM_{10} are supplemented by the Burbank – W Palm Avenue Monitoring Station. The most current five years of data monitored at these monitoring stations are included in Table 3. The data show recurring violations of the federal $PM_{2.5}$ standard, state PM_{10} standard, and both the state and federal O_3 standards. The CO, NO_2, and SO_2 standards and have not been violated in the last five years.

Table 3 Ambient Air Quality Monitoring Summary

Pollutant/Standard	Number of Days Threshold Were Exceeded and Maximum Levels during Such Violations				
	2012	2013	2014	2015	2016
Ozone (O_3)[1]					
State 1-Hour ≥ 0.09 ppm (days exceed threshold)	18	7	6	11	9
State 8-hour ≥ 0.07 ppm (days exceed threshold)	39	21	31	34	23
Federal 8-Hour > 0.075 ppm (days exceed threshold)	23	11	11	15	14
Max. 1-Hour Conc. (ppm)	0.129	0.124	0.116	0.119	0.122
Max. 8-Hour Conc. (ppm)	0.098	0.092	0.092	0.094	0.098
Carbon Monoxide (CO)[1]					
State 8-Hour > 9.0 ppm (days exceed threshold)	0	*	*	*	*
Federal 8-Hour ≥ 9.0 ppm (days exceed threshold)	0	*	*	*	*
Max. 8-Hour Conc. (ppm)	2.70	*	*	*	*
Nitrogen Dioxide (NO_2)[1]					
State 1-Hour ≥ 0.18 ppm (days exceed threshold)	0	0	0	0	0
Federal 1-Hour ≥ 0.100 ppm (days exceed threshold)	0	0	0	0	0
Max. 1-Hour Conc. (ppb)	0.0709	0.0581	0.0589	0.0725	0.0555
Sulfur Dioxide (SO_2)[2]					
State 24-Hour ≥ 0.04 ppm (days exceed threshold)	0	0	*	*	*
Federal 24-Hour ≥ 0.14 ppm (days exceed threshold)	0	0	*	*	*
Max 24-Hour Conc. (ppm)	0.002	0.002	*	*	*
Coarse Particulates (PM_{10})[2]					
State 24-Hour > 50 µg/m³ (days exceed threshold)	1	1	1	*	*
Federal 24-Hour > 150 µg/m³ (days exceed threshold)	0	0	0	*	*
Max. 24-Hour Conc. (µg/m³)	55.0	53.3	68.6	*	*
Fine Particulates ($PM_{2.5}$)[1]					
Federal 24-Hour > 35 µg/m³ (days exceed threshold)	2	1	0	1	0
Max. 24-Hour Conc. (µg/m³)	41.6	41.8	27.2	36.8	41.5

Sensitive Receptors

Some land uses are considered more sensitive to air pollution than others due to the types of population groups or activities involved. Sensitive population groups include children, the elderly, the acutely ill, and the chronically ill, especially those with cardio-respiratory diseases.

Residential areas are also considered to be sensitive receptors to air pollution because residents (including children and the elderly) tend to be at home for extended periods of time, resulting in sustained exposure to any pollutants present. Schools are also considered sensitive receptors, as children are present for extended durations and engage in regular outdoor activities. Recreational land uses are considered moderately sensitive to air pollution. Although exposure periods are generally short, exercise places a high demand on respiratory functions, which can be impaired by air pollution. In addition, noticeable air pollution can detract from the

enjoyment of recreation. Industrial and commercial areas are considered the least sensitive to air pollution. Exposure periods are relatively short and intermittent, as the majority of the workers tend to stay indoors most of the time. In addition, the working population is generally the healthiest segment of the public.

Methodology

Projected construction-related air pollutant emissions are calculated using the California Emissions Estimator Model (CalEEMod), Version 2016.3.1, distributed by the California Air Pollutant Control Officers Association (CAPCOA 2016). CalEEMod compiles an emissions inventory of construction (fugitive dust, off-gas emissions, onroad emissions, and offroad emissions), area sources, indirect emissions from energy use, mobile sources, indirect emissions from waste disposal (annual only), and indirect emissions from water/wastewater (annual only) use. The calculated emissions of the project are compared to thresholds of significance for individual projects using the SCAQMD's CEQA Air Quality Analysis Guidance Handbook (SCAQMD 1993).

Thresholds of Significance

The analysis of the proposed project's air quality impacts follows the guidance and methodologies recommended in SCAQMD's *CEQA Air Quality Handbook* and the significance thresholds on SCAQMD's website.[6] CEQA allows the significance criteria established by the applicable air quality management or air pollution control district to be used to assess impacts of a project on air quality. SCAQMD has established thresholds of significance for regional air quality emissions for construction activities and project operation. In addition to the daily thresholds listed above, projects are also subject to the AAQS. These are addressed though an analysis of localized CO impacts and localized significance thresholds (LSTs).

REGIONAL SIGNIFICANCE THRESHOLDS

SCAQMD has adopted regional construction and operational emissions thresholds to determine a project's cumulative impact on air quality in the SoCAB. Table 4, *SCAQMD Significance Thresholds*, lists SCAQMD's regional significance thresholds that are applicable for all projects uniformly regardless of size or scope. There is growing evidence that although ultrafine particulates contribute a very small portion of the overall atmospheric mass concentration, they represent a greater proportion of the health risk from PM. However, the EPA or CARB have not yet adopted AAQS to regulate ultrafine particulates; therefore, SCAQMD has not developed thresholds for them.

[6] SCAQMD's Air Quality Significance Thresholds are current as of March 2015 and can be found here: http://www.aqmd.gov/ceqa/hdbk.html.

Table 4 SCAQMD Significance Thresholds

Air Pollutant	Construction Phase	Operational Phase
Reactive Organic Gases (ROGs)/ Volatile Organic Compounds (VOCs)	75 lbs/day	55 lbs/day
Nitrogen Oxides (NO_X)	100 lbs/day	55 lbs/day
Carbon Monoxide (CO)	550 lbs/day	550 lbs/day
Sulfur Oxides (SO_X)	150 lbs/day	150 lbs/day
Particulates (PM_{10})	150 lbs/day	150 lbs/day
Particulates ($PM_{2.5}$)	55 lbs/day	55 lbs/day

Source: SCAQMD 2015b.

Projects that exceed the regional significance threshold contribute to the nonattainment designation of the SoCAB. The attainment designations are based on the AAQS, which are set at levels of exposure that are determined to not result in adverse health. Exposure to fine particulate pollution and ozone causes myriad health impacts, particularly to the respiratory and cardiovascular systems:

- Linked to increased cancer risk ($PM_{2.5}$, TACs)
- Aggravates respiratory disease (O_3, $PM_{2.5}$)
- Increases bronchitis (O_3, $PM_{2.5}$)
- Causes chest discomfort, throat irritation, and increased effort to take a deep breath (O_3)
- Reduces resistance to infections and increases fatigue (O_3)
- Reduces lung growth in children ($PM_{2.5}$)
- Contributes to heart disease and heart attacks ($PM_{2.5}$)
- Contributes to premature death (O_3, $PM_{2.5}$)
- Linked to lower birth weight in newborns ($PM_{2.5}$) (SCAQMD 2015c)

Exposure to fine particulates and ozone aggravates asthma attacks and can amplify other lung ailments such as emphysema and chronic obstructive pulmonary disease. Exposure to current levels of $PM_{2.5}$ is responsible for an estimated 4,300 cardiopulmonary-related deaths per year in the SoCAB. In addition, University of Southern California scientists responsible for a landmark children's health study found that lung growth improved as air pollution declined for children aged 11 to 15 in five communities in the SoCAB (SCAQMD 2015d).

Mass emissions in Table 4 are not correlated with concentrations of air pollutants but contribute to the cumulative air quality impacts in the SoCAB. Therefore, regional emissions from a single project do not single-handedly trigger a regional health impact. SCAQMD is the primary agency responsible for ensuring the health and welfare of sensitive individuals to elevated concentrations of air quality in the SoCAB. To achieve the health-based standards established by the EPA, SCAQMD prepares an AQMP that details regional programs to attain the AAQS.

CO HOTSPOTS

Areas of vehicle congestion have the potential to create pockets of CO called hot spots. These pockets have the potential to exceed the state one-hour standard of 20 ppm or the eight-hour standard of 9 ppm. Because CO is produced in greatest quantities from vehicle combustion and does not readily disperse into the atmosphere, adherence to ambient air quality standards is typically demonstrated through an analysis of localized CO concentrations. Hot spots are typically produced at intersections, where traffic congestion is highest because vehicles queue for longer periods and are subject to reduced speeds. Typically, for an intersection to exhibit a significant CO concentration, it would operate at level of service (LOS) E or worse without improvements (Caltrans 1997). However, at the time of the 1993 Handbook, the SoCAB was designated nonattainment under the California AAQS and National AAQS for CO.

With the turnover of older vehicles, introduction of cleaner fuels, and implementation of control technology on industrial facilities, CO concentrations in the SoCAB and in the state have steadily declined. In 2007, the SoCAB was designated in attainment for CO under both the California AAQS and National AAQS. The CO hot spot analysis conducted for the attainment by SCAQMD for busiest intersections in Los Angeles during the peak morning and afternoon periods plan did not predict a violation of CO standards. [7] As identified in SCAQMD's 2003 AQMP and the 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan), peak carbon monoxide concentrations in the SoCAB in previous years, prior to redesignation, were a result of unusual meteorological and topographical conditions and not a result of congestion at a particular intersection. Under existing and future vehicle emission rates, a project would have to increase traffic volumes at a single intersection by more than 44,000 vehicles per hour—or 24,000 vehicles per hour where vertical and/or horizontal air does not mix—in order to generate a significant CO impact (BAAQMD 2017).

LOCALIZED SIGNIFICANCE THRESHOLDS

SCAQMD developed LSTs for emissions of NO_2, CO, PM_{10}, and $PM_{2.5}$ generated at the project site (offsite mobile-source emissions are not included in the LST analysis). LSTs represent the maximum emissions at a project site that are not expected to cause or contribute to an exceedance of the most stringent federal or state AAQS and are shown in Table 5, *SCAQMD Localized Significance Thresholds*.

[7] The four intersections were: Long Beach Boulevard and Imperial Highway; Wilshire Boulevard and Veteran Avenue; Sunset Boulevard and Highland Avenue; and La Cienega Boulevard and Century Boulevard. The busiest intersection evaluated (Wilshire and Veteran) had a daily traffic volume of approximately 100,000 vehicles per day with LOS E in the morning peak hour and LOS F in the evening peak hour.

Table 5 SCAQMD Localized Significance Thresholds

Air Pollutant (Relevant AAQS)	Concentration
1-Hour CO Standard (CAAQS)	20 ppm
8-Hour CO Standard (CAAQS)	9.0 ppm
1-Hour NO_2 Standard (CAAQS)	0.18 ppm
Annual NO_2 Standard (CAAQS)	0.03 ppm
24-Hour PM_{10} Standard – Construction (SCAQMD)[1]	10.4 µg/m^3
24-Hour $PM_{2.5}$ Standard – Construction (SCAQMD)[1]	10.4 µg/m^3
24-Hour PM_{10} Standard – Operation (SCAQMD)[1]	2.5 µg/m^3
24-Hour $PM_{2.5}$ Standard – Operation (SCAQMD)[1]	2.5 µg/m^3

Source: SCAQMD 2015b.
ppm – parts per million; µg/m^3 – micrograms per cubic meter
[1] Threshold is based on SCAQMD Rule 403. Since the SoCAB is in nonattainment for PM_{10} and $PM_{2.5}$, the threshold is established as an allowable change in concentration. Therefore, background concentration is irrelevant.

To assist lead agencies, SCAQMD developed screening-level LSTs to back-calculate the mass amount (lbs. per day) of emissions generated onsite that would trigger the levels shown in Table 5 for projects under 5-acres. These "screening-level" LSTs tables are the localized significance thresholds for all projects of five acres and less; however, it can be used as screening criteria for larger projects to determine whether or not dispersion modeling may be required to compare concentrations of air pollutants generated by the project to the localized concentrations shown in Table 5.

In accordance with SCAQMD's LST methodology, construction LSTs are based on the acreage disturbed per day based on equipment use. The construction LSTs for the project site in SRA 4 are shown in Table 6, *SCAQMD Screening-Level Construction Localized Significance Thresholds,* for receptors within 82 feet (25 meters).

Table 6 SCAQMD Construction Localized Significance Thresholds

	Threshold (lbs/day)[1]			
Acreage Disturbed	Nitrogen Oxides (NO_X)	Carbon Monoxide (CO)	Coarse Particulates (PM_{10})	Fine Particulates ($PM_{2.5}$)
≤1.00 Acre Disturbed Per Day	57	585	4.00	3.00
<1.17 Acres Disturbed Per Day	61	629	4.51	3.34

Source: SCAQMD 2008b.
[1] LSTs are based on receptors within 82 feet (25 meters) in SRA 4.

Because the project is not an industrial project that has the potential to emit substantial sources of stationary emissions, operational LSTs are not an air quality impact of concern associated with the project.

Whenever a project would require use of chemical compounds that have been identified in SCAQMD Rule 1401, placed on CARB's air toxics list pursuant to AB 1807, or placed on the EPA's National Emissions Standards for Hazardous Air Pollutants, a health risk assessment is required by the SCAQMD. Table 7, *Toxic Air Contaminants Incremental Risk Thresholds*, lists the TAC incremental risk thresholds for operation of a project. The purpose of this environmental evaluation is to identify the significant effects of the proposed project on the environment, not the significant effects of the environment on the proposed project.

(*California Building Industry Association v. Bay Area Air Quality Management District (2015) 62 Cal.4th 369 (Case No. S213478)*). CEQA does not require CEQA-level environmental document to analyze the environmental effects of attracting development and people to an area. However, the environmental document must analyze the impacts of environmental hazards on future users, when a proposed project exacerbates an existing environmental hazard or condition. Residential, commercial, and office uses do not use substantial quantities of TACs and typically do not exacerbate existing hazards, so these thresholds are typically applied to new industrial projects.

Table 7 SCAQMD Toxic Air Contaminants Incremental Risk Thresholds

Maximum Incremental Cancer Risk	≥ 10 in 1 million
Hazard Index (project increment)	≥ 1.0
Cancer Burden in areas ≥ 1 in 1 million	> 0.5 excess cancer cases

Source: SCAQMD 2015b.

GREENHOUSE GAS EMISSIONS

Scientists have concluded that human activities are contributing to global climate change by adding large amounts of heat-trapping gases, known as GHG, to the atmosphere. Climate change is the variation of Earth's climate over time, whether due to natural variability or as a result of human activities. The primary source of these GHG is fossil fuel use. The Intergovernmental Panel on Climate Change (IPCC) has identified four major GHG—water vapor,[8] carbon (CO_2), methane (CH_4), and ozone (O_3)—that are the likely cause of an increase in global average temperatures observed within the 20th and 21st centuries. Other GHG identified by the IPCC that contribute to global warming to a lesser extent include nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons, perfluorocarbons, and chlorofluorocarbons (IPCC 2001).[9] The major GHG are briefly described below.

- **Carbon dioxide (CO_2)** enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, and respiration, and also as a result of other chemical reactions (e.g. manufacture of cement). Carbon dioxide is removed from the atmosphere (sequestered) when it is absorbed by plants as part of the biological carbon cycle.

- **Methane (CH_4)** is emitted during the production and transport of coal, natural gas, and oil. Methane emissions also result from livestock and other agricultural practices and from the decay of organic waste in municipal landfills and water treatment facilities.

- **Nitrous oxide (N_2O)** is emitted during agricultural and industrial activities as well as during combustion of fossil fuels and solid waste.

- **Fluorinated gases** are synthetic, strong GHGs that are emitted from a variety of industrial processes. Fluorinated gases are sometimes used as substitutes for ozone-depleting substances. These gases are typically emitted in smaller quantities, but because they are potent GHGs, they are sometimes referred to as high global-warming-potential (GWP) gases.

    - *Chlorofluorocarbons (CFCs*) are GHGs covered under the 1987 Montreal Protocol and used for refrigeration, air conditioning, packaging, insulation, solvents, or aerosol propellants. Since they are not destroyed in the lower atmosphere (troposphere, stratosphere), CFCs drift into the upper atmosphere where, given suitable conditions, they break down ozone. These gases are also ozone-

[8] Water vapor (H_2O) is the strongest GHG and the most variable in its phases (vapor, cloud droplets, ice crystals). However, water vapor is not considered a pollutant, but part of the feedback loop o rather than a primary cause of change.

[9] Black carbon contributes to climate change both directly, by absorbing sunlight, and indirectly, by depositing on snow (making it melt faster) and by interacting with clouds and affecting cloud formation. Black carbon is the most strongly light-absorbing component of particulate matter (PM) emitted from burning fuels such as coal, diesel, and biomass. Reducing black carbon emissions globally can have immediate economic, climate, and public health benefits. California has been an international leader in reducing emissions of black carbon, with close to 95 percent control expected by 2020 due to existing programs that target reducing PM from diesel engines and burning activities (CARB 2017c). However, state and national GHG inventories do not yet include black carbon due to ongoing work resolving the precise global warming potential of black carbon. Guidance for CEQA documents does not yet include black carbon.

depleting gases and are therefore being replaced by other compounds that are GHGs covered under the Kyoto Protocol.

- ***Perfluorocarbons (PFCs)*** are a group of human-made chemicals composed of carbon and fluorine only. These chemicals (predominantly perfluoromethane [CF_4] and perfluoroethane [C_2F_6]) were introduced as alternatives, along with HFCs, to the ozone-depleting substances. In addition, PFCs are emitted as by-products of industrial processes and are used in manufacturing. PFCs do not harm the stratospheric ozone layer, but they have a high global warming potential.

- ***Sulfur Hexafluoride (SF6)*** is a colorless gas soluble in alcohol and ether, slightly soluble in water. SF_6 is a strong GHG used primarily in electrical transmission and distribution systems as an insulator.

- ***Hydrochlorofluorocarbons (HCFCs)*** contain hydrogen, fluorine, chlorine, and carbon atoms. Although ozone-depleting substances, they are less potent at destroying stratospheric ozone than CFCs. They have been introduced as temporary replacements for CFCs and are also GHGs.

- ***Hydrofluorocarbons (HFCs)*** contain only hydrogen, fluorine, and carbon atoms. They were introduced as alternatives to ozone-depleting substances to serve many industrial, commercial, and personal needs. HFCs are emitted as by-products of industrial processes and are also used in manufacturing. They do not significantly deplete the stratospheric ozone layer, but they are strong GHGs (IPCC 2001; USEPA 2017b).

GHGs are dependent on the lifetime or persistence of the gas molecule in the atmosphere. Some GHGs have stronger greenhouse effects than others. These are referred to as high GWP gases. The GWP of GHG emissions are shown in Table 8, *GHG Emissions and Their Relative Global Warming Potential Compared to CO_2*. The GWP is used to convert GHGs to CO_2-equivalence (CO_2e) to show the relative potential that different GHGs have to retain infrared radiation in the atmosphere and contribute to the greenhouse effect. For example, under IPCC's Fourth Assessment Report GWP values for CH_4, a project that generates 10 metric tons (MT) of CH_4 would be equivalent to 250 MT of CO_2.[10]

[10] CO_2-equivalence is used to show the relative potential that different GHGs have to retain infrared radiation in the atmosphere and contribute to the greenhouse effect. The global warming potential of a GHG is also dependent on the lifetime, or persistence, of the gas molecule in the atmosphere.

Table 8 GHG Emissions and Their Relative Global Warming Potential Compared to CO_2

GHGs	Second Assessment Report Atmospheric Lifetime (Years)	Fourth Assessment Report Atmospheric Lifetime (Years)	Second Assessment Report Global Warming Potential Relative to CO_2[1]	Fourth Assessment Report Global Warming Potential Relative to CO_2[1]
Carbon Dioxide (CO_2)	50 to 200	50 to 200	1	1
Methane[2] (CH_4)	12 (±3)	12	21	25
Nitrous Oxide (N_2O)	120	114	310	298
Hydrofluorocarbons:				
HFC-23	264	270	11,700	14,800
HFC-32	5.6	4.9	650	675
HFC-125	32.6	29	2,800	3,500
HFC-134a	14.6	14	1,300	1,430
HFC-143a	48.3	52	3,800	4,470
HFC-152a	1.5	1.4	140	124
HFC-227ea	36.5	34.2	2,900	3,220
HFC-236fa	209	240	6,300	9,810
HFC-4310mee	17.1	15.9	1,300	1,030
Perfluoromethane: CF_4	50,000	50,000	6,500	7,390
Perfluoroethane: C_2F_6	10,000	10,000	9,200	12,200
Perfluorobutane: C_4F_{10}	2,600	NA	7,000	8,860
Perfluoro-2-methylpentane: C_6F_{14}	3,200	NA	7,400	9,300
Sulfur Hexafluoride (SF_6)	3,200	NA	23,900	22,800

Source: IPCC 1995; IPCC 2007.

Notes: The IPCC has published updated global warming potential (GWP) values in its Fifth Assessment Report (IPCC 2013) that reflect new information on atmospheric lifetimes of GHGs and an improved calculation of the radiative forcing of CO_2. However, GWP values identified in the Fourth Assessment Report are used by SCAQMD to maintain consistency in statewide GHG emissions modeling. In addition, the 2014 Scoping Plan Update was based on the GWP values in the Fourth Assessment Report.

1 Based on 100-year time horizon of the GWP of the air pollutant relative to CO_2.

2 The methane GWP includes direct effects and indirect effects due to the production of tropospheric ozone and stratospheric water vapor. The indirect effect due to the production of CO_2 is not included.

Regulatory Settings

REGULATION OF GHG EMISSIONS ON A NATIONAL LEVEL

The U.S. Environmental Protection Agency (EPA) announced on December 7, 2009, that GHG emissions threaten the public health and welfare of the American people and that GHG emissions from on-road vehicles contribute to that threat. The EPA's final findings respond to the 2007 U.S. Supreme Court decision that GHG emissions fit within the Clean Air Act definition of air pollutants. The findings do not in and of themselves impose any emission reduction requirements, but allow the EPA to finalize the GHG standards proposed in 2009 for new light-duty vehicles as part of the joint rulemaking with the Department of Transportation (USEPA 2009).

The EPA's endangerment finding covers emissions of six key GHGs—CO_2, CH_4, N_2O, hydro fluorocarbons, per fluorocarbons, and SF_6—that have been the subject of scrutiny and intense analysis for

decades by scientists in the United States and around the world (the first three are applicable to the proposed project).

In response to the endangerment finding, the EPA issued the Mandatory Reporting of GHG Rule that requires substantial emitters of GHG emissions (large stationary sources, etc.) to report GHG emissions data. Facilities that emit 25,000 metric tons (MT) or more of CO_2 per year are required to submit an annual report.

US Mandatory Report Rule for GHGs (2009)

In response to the endangerment finding, the EPA issued the Mandatory Reporting of GHG Rule that requires substantial emitters of GHG emissions (large stationary sources, etc.) to report GHG emissions data. Facilities that emit 25,000 MT or more of CO_2 per year are required to submit an annual report.

Update to Corporate Average Fuel Economy Standards (2010/2012)

The current Corporate Average Fuel Economy (CAFE) standards (for model years 2011 to 2016) incorporate stricter fuel economy requirements promulgated by the federal government and California into one uniform standard. Additionally, automakers are required to cut GHG emissions in new vehicles by roughly 25 percent by 2016 (resulting in a fleet average of 35.5 miles per gallon [mpg] by 2016). Rulemaking to adopt these new standards was completed in 2010. California agreed to allow automakers who show compliance with the national program to also be deemed in compliance with state requirements. The federal government issued new standards in 2012 for model years 2017–2025, which will require a fleet average of 54.5 mpg in 2025.

EPA Regulation of Stationary Sources under the Clean Air Act (Ongoing)

Pursuant to its authority under the CAA, the EPA has been developing regulations for new stationary sources such as power plants, refineries, and other large sources of emissions. Pursuant to the former President Obama's 2013 Climate Action Plan, the EPA was directed to also develop regulations for existing stationary sources. However, the EPA is reviewing the Clean Power Plan under President Trump's Energy Independence Executive Order.

REGULATION OF GHG EMISSIONS ON A STATE LEVEL

Current State of California guidance and goals for reductions in GHG emissions are generally embodied in Executive Order S-03-05, Executive Order B-30-15, Assembly Bill 32 (AB 32), Senate Bill 32 (SB 32), and Senate Bill 375 (SB 375).

Executive Order S-03-05

Executive Order S-03-05, signed June 1, 2005. Executive Order S-03-05 set the following GHG reduction targets for the State:

- 2000 levels by 2010
- 1990 levels by 2020
- 80 percent below 1990 levels by 2050

Assembly Bill 32, the Global Warming Solutions Act (2006)

Current State of California guidance and goals for reductions in GHG emissions are generally embodied in AB 32, the Global Warming Solutions Act. AB 32 was passed by the California state legislature on August 31, 2006, to place the state on a course toward reducing its contribution of GHG emissions. AB 32 follows the 2020 tier of emissions reduction targets established in Executive Order S-03-05.

CARB 2008 Scoping Plan

The final Scoping Plan was adopted by CARB on December 11, 2008. The *2008 Scoping Plan* identified that GHG emissions in California are anticipated to be approximately 596 $MMTCO_2e$ in 2020 (CARB 2008). In December 2007, CARB approved a 2020 emissions limit of 427 $MMTCO_2e$ (471 million tons) for the state (CARB 2008). In order to effectively implement the emissions cap, AB 32 directed CARB to establish a mandatory reporting system to track and monitor GHG emissions levels for large stationary sources that generate more than 25,000 $MTCO_2e$ per year, prepare a plan demonstrating how the 2020 deadline can be met, and develop appropriate regulations and programs to implement the plan by 2012.

First Update to the Scoping Plan

CARB completed a five-year update to the 2008 Scoping Plan, as required by AB 32. The First Update to the Scoping Plan was adopted at the May 22, 2014, board hearing. The update highlights California's progress toward meeting the near-term 2020 GHG emission reduction goals defined in the original 2008 Scoping Plan. As part of the update, CARB recalculated the 1990 GHG emission levels with the updated GWPs in the Fourth Assessment Report, and the 427 $MMTCO_2e$ 1990 emissions level and 2020 GHG emissions limit, established in response to AB 32, is slightly higher at 431 $MMTCO_2e$ (CARB 2014).

As identified in the Update to the Scoping Plan, California is on track to meeting the goals of AB 32. However, the update also addresses the state's longer-term GHG goals within a post-2020 element. The post-2020 element provides a high level view of a long-term strategy for meeting the 2050 GHG goals, including a recommendation for the state to adopt a midterm target. According to the Update to the Scoping Plan, local government reduction targets should chart a reduction trajectory that is consistent with or exceeds the trajectory created by statewide goals (CARB 2014). CARB identified that reducing emissions to 80 percent below 1990 levels will require a fundamental shift to efficient, clean energy in every sector of the economy. Progressing toward California's 2050 climate targets will require significant acceleration of GHG reduction rates. Emissions from 2020 to 2050 will have to decline several times faster than the rate needed to reach the 2020 emissions limit (CARB 2014).

Executive Order B-30-15

Executive Order B-30-15, signed April 29, 2015, sets a goal of reducing GHG emissions within the state to 40 percent of 1990 levels by year 2030. Executive Order B-30-15 also directs CARB to update the Scoping Plan to quantify the 2030 GHG reduction goal for the State and requires state agencies to implement measures to meet the interim 2030 goal as well as the long-term goal for 2050 in Executive Order S-03-05. It also requires the Natural Resources Agency to conduct triennial updates the California adaption strategy,

Safeguarding California, in order to ensure climate change is accounted for in State planning and investment decisions.

Senate Bill 32 and Assembly Bill 197

In September 2016, Governor Brown signed SB 32 and Assembly Bill 197 (AB 197) into law, making the Executive Order goal for year 2030 into a statewide mandated legislative target. AB 197 established a joint legislative committee on climate change policies and requires the CARB to prioritize direction emissions reductions rather than the market-based cap-and-trade program for large stationary, mobile, and other sources.

2017 Climate Change Scoping Plan Update

Executive Order B-30-15 and SB 32 required CARB to prepare another update to the Scoping Plan to address the 2030 target for the state. On January 20, 2017, CARB released the *Draft 2017 Climate Change Scoping Plan Update* with adoption hearings planned for summer of 2017. The *Draft 2017 Climate Change Scoping Plan Update* includes the potential regulations and programs including strategies consistent with AB 197 requirements to achieve the 2030 target. The 2017 Scoping Plan establishes a new emissions limit of 260 $MMTCO_2e$ for the year 2030, which corresponds to a 40 percent decrease in 1990 levels by 2030 (CARB 2017b).

California's climate strategy will require contributions from all sectors of the economy, including the land base, and will include enhanced focus on zero- and near-zero emission (ZE/NZE) vehicle technologies; continued investment in renewables, including solar roofs, wind, and other distributed generation; greater use of low carbon fuels; integrated land conservation and development strategies; coordinated efforts to reduce emissions of short-lived climate pollutants (methane, black carbon, and fluorinated gases); and an increased focus on integrated land use planning, to support livable, transit-connected communities and conservation of agricultural and other lands. Requirements for direct GHG reductions at refineries will further support air quality co-benefits in neighborhoods, including in disadvantaged communities historically located adjacent to these large stationary sources, as well as efforts with California's local air pollution control and air quality management districts (air districts) to tighten emission limits on a broad spectrum of industrial sources. Major elements of the 2017 Scoping Plan framework include:

- Implementing and/or increasing the standards of the Mobile Source Strategy, which include increasing ZEV buses and trucks;
- Low Carbon Fuel Standard (LCFS), with an increased stringency (18 percent by 2030);
- Implementation of SB 350, which expands the Renewables Portfolio Standard (RPS) to 50 percent RPS and doubles energy efficiency savings by 2030;
- California Sustainable Freight Action Plan, which improves freight system efficiency, utilizes near-zero emissions technology, and deployment of ZEV trucks;

- Implementing the Short-Lived Climate Pollutant Strategy (SLPS), which focuses on reducing methane and hydroflurocarbon emissions by 40 percent and anthropogenic black carbon emissions by 50 percent by year 2030;
- Continued implementation of SB 375;
- Post-2020 Cap-and-Trade Program that includes declining caps;
- 20 percent reduction in GHG emissions from refineries by 2030[11]; and
- Development of a Natural and Working Lands Action Plan to secure California's land base as a net carbon sink.

In addition to the statewide strategies listed above, the *2017 Climate Change Scoping Plan* also identified local governments as essential partners in achieving the State's long-term GHG reduction goals and identified local actions to reduce GHG emissions. As part of the recommended actions, CARB recommends that local governments achieve a community-wide goal to achieve emissions of no more than 6 $MTCO_2e$ or less per capita by 2030 and 2 $MTCO_2e$ or less per capita by 2050. For CEQA projects, CARB states that lead agencies may develop evidenced-based bright-line numeric thresholds—consistent with the Scoping Plan and the State's long-term GHG goals—and projects with emissions over that amount may be required to incorporate on-site design features and mitigation measures that avoid or minimize project emissions to the degree feasible; or, a performance-based metric using a climate action plan or other plan to reduce GHG emissions is appropriate (CARB 2017b).

The Scoping Plan scenario is set against what is called the business-as-usual (BAU) yardstick—that is, what the GHG emissions would look like if the State did nothing at all beyond the existing policies that are required and already in place to achieve the 2020 limit, as shown in Table 9, *2017 Climate Change Scoping Plan Emissions Reductions Gap to Achieve the 2030 GHG Target*. It includes the existing renewables requirements, advanced clean cars, the "10 percent" Low Carbon Fuel Standard (LCFS), and the SB 375 program for more vibrant communities, among others. However, it does not include a range of new policies or measures that have been developed or put into statute over the past two years, Also shown in the table, the known commitments are expected to result in emissions that are 50 $MMTCO_2e$ above the target in 2030. In order to make up the "gap", a new Post- 2020 Cap-and-Trade Program and refinery measure are key components of the 2017 Scoping Plan.

[11] The plan includes policies to require direct GHG reductions at some of the State's largest stationary sources and mobile sources in accordance with AB 197. These policies include the use of lower GHG fuels, efficiency regulations, and the Cap-and-Trade Program, which constrains and reduces emissions at covered sources.

Table 9 2017 Climate Change Scoping Plan Emissions Reductions Gap to Achieve the 2030 GHG Target

Modeling Scenario	2030 GHG Emissions $MMTCO_2e$
Reference Scenario (Business-as-Usual)	392.4
With Known Commitments	310
2030 GHG Target	260

Notes: TCU = Transportation, Communications, and Utilities; TBD: To Be Determined.
[1] Work is underway through 2017 to estimate the range of potential sequestration benefits from the natural and working lands sector.

Senate Bill 1383

On September 19, 2016, the Governor signed SB 1383 to supplement the GHG reduction strategies in the Scoping Plan to consider short-lived climate pollutants, including black carbon and CH_4. Black carbon is the light-absorbing component of fine particulate matter (PM) produced during incomplete combustion of fuels. SB 1383 requires the state board, no later than January 1, 2018, to approve and begin implementing that comprehensive strategy to reduce emissions of short-lived climate pollutants to achieve a reduction in methane by 40 percent, hydrofluorocarbon gases by 40 percent, and anthropogenic black carbon by 50 percent below 2013 levels by 2030, as specified. The bill also establishes targets for reducing organic waste in landfill. On March 14, 2017, CARB adopted the *Short-Lived Climate Pollutant Strategy*, which identifies the state's approach to reducing anthropogenic and biogenic sources of short-lived climate pollutants. Anthropogenic

sources of black carbon include on- and off-road transportation, residential wood burning, fuel combustion (charbroiling), and industrial processes. According to CARB, ambient levels of black carbon in California are 90 percent lower than in the early 1960s, despite the tripling of diesel fuel use (CARB 2017c). In-use on-road rules are expected to reduce black carbon emissions from on-road sources by 80 percent between 2000 and 2020. SCAQMD is one of the air districts that requires air pollution control technologies for chain-driven broilers, which reduces particulate emissions from these charbroilers by over 80 percent (CARB 2017c). Additionally, SCAQMD Rule 445, wood-burning devices limits installation of new fireplaces in the SoCAB.

SB 375 – Regional Transportation Plan (RTP) / Sustainable Communities Strategy (SCS)

In 2008, Senate Bill 375 (SB 375), the Sustainable Communities and Climate Protection Act, was adopted to connect the GHG emissions reductions targets established in the 2008 Scoping Plan for the transportation sector to local land use decisions that affect travel behavior. Its intent is to reduce GHG emissions from light-duty trucks and automobiles (excludes emissions associated with goods movement) by aligning regional long-range transportation plans, investments, and housing allocations to local land use planning to reduce VMT and vehicle trips. Specifically, SB 375 required CARB to establish GHG emissions reduction targets for each of the 18 metropolitan planning organizations (MPOs). Southern California Association of Governments (SCAG) is the MPO for the Southern California region, which includes the counties of Los Angeles, Orange, San Bernardino, Riverside, Ventura, and Imperial.

Pursuant to the recommendations of the Regional Transportation Advisory Committee, CARB adopted per capita reduction targets for each of the MPOs rather than a total magnitude reduction target. SCAG's targets are an 8 percent per capita reduction from 2005 GHG emission levels by 2020 and a 13 percent per capita reduction from 2005 GHG emission levels by 2035 (CARB 2010). SB 375 requires CARB to periodically update the targets, no later than every 8 years. CARB plans to propose updated targets for consideration in 2016, with the intent to make them effective in 2018. Sustainable communities strategies (SCSs) adopted in 2018 would be subject to the updated targets (CARB 2015).

The 2020 targets are smaller than the 2035 targets because a significant portion of the built environment in 2020 has been defined by decisions that have already been made. In general, the 2020 scenarios reflect that more time is needed for large land use and transportation infrastructure changes. Most of the reductions in the interim are anticipated to come from improving the efficiency of the region's transportation network. The targets would result in 3 $MMTCO_2e$ of reductions by 2020 and 15 $MMTCO_2e$ of reductions by 2035. Based on these reductions, the passenger vehicle target in CARB's Scoping Plan (for AB 32) would be met (CARB 2010).

SB 375 requires CARB to periodically update the targets, no later than every 8 years. CARB plans to propose updated targets for consideration in 2016, with the intent to make them effective in 2018. Considerations for the next round of targets include whether to change the nature or magnitude of the emissions reduction targets for each of the MPOs, and whether the target-setting methodology should account for advances in technologies that reduce emissions. Such changes in methodology would permit cities to account for emissions reductions from advances in cleaner fuels and vehicles and not only from land use and transportation planning strategies.

SCAG's 2016-2040 RTP/SCS

SB 375 requires the MPOs to prepare a sustainable communities strategy in their regional transportation plan. For the SCAG region, the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) was adopted on April 7, 2016 and is an update to the 2012 RTP/SCS (SCAG 2016). In general, the SCS outlines a development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, would reduce vehicle miles traveled from automobiles and light duty trucks and thereby reduce GHG emissions from these sources.

The 2016-2040 RTP/SCS projects that the SCAG region will meet or exceed the passenger per capita targets set in 2010 by CARB. It is projected that VMT per capita in the region for year 2040 would be reduced by 7.4 percent with implementation of the 2016-2040 RTP/SCS compared to a no-plan year 2040 scenario. Under the 2016-2040 RTP/SCS, SCAG anticipates lowering GHG emissions 8 percent below 2005 levels by 2020, 18 percent by 2035, and 21 percent by 2040. The 18 percent reduction by 2035 over 2005 levels represents a 2 percent increase in reduction compared to the 2012 RTP/SCS projection. Overall, the SCS is meant to provide growth strategies that will achieve the aforementioned regional GHG emissions reduction targets. Land use strategies to achieve the region's targets include planning for new growth around High Quality Transit Areas and Livable Corridors, and creating Neighborhood Mobility Areas to integrate land use and transportation and plan for more active lifestyles (SCAG 2016). However, the SCS does not require that local general plans, specific plans, or zoning be consistent with SCS; instead, it provides incentives to governments and developers for consistency.

Assembly Bill 1493

California vehicle GHG emission standards were enacted under AB 1493 (Pavley I). Pavley I is a clean-car standard that reduces GHG emissions from new passenger vehicles (light-duty auto to medium-duty vehicles) from 2009 through 2016 and is anticipated to reduce GHG emissions from new passenger vehicles by 30 percent in 2016. California implements the Pavley I standards through a waiver granted to California by the EPA. In 2012, the EPA issued a Final Rulemaking that sets even more stringent fuel economy and GHG emissions standards for model year 2017 through 2025 light-duty vehicles (see also the discussion on the update to the CAFE standards under *Federal Laws*, above). In January 2012, CARB approved the Advanced Clean Cars program (formerly known as Pavley II) for model years 2017 through 2025. The program combines the control of smog, soot, and global warming gases and requirements for greater numbers of zero-emission vehicles into a single package of standards. Under California's Advanced Clean Car program, by 2025, new automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions.

Executive Order S-01-07

On January 18, 2007, the state set a new low carbon fuel standard (LCFS) for transportation fuels sold within the state. Executive Order S-01-07 sets a declining standard for GHG emissions measured in carbon dioxide equivalent gram per unit of fuel energy sold in California. The LCFS requires a reduction of 2.5 percent in the carbon intensity of California's transportation fuels by 2015 and a reduction of at least 10 percent by 2020. The standard applies to refiners, blenders, producers, and importers of transportation fuels, and would

use market-based mechanisms to allow these providers to choose how they reduce emissions during the "fuel cycle" using the most economically feasible methods.

Executive Order B-16-2012

On March 23, 2012, the state identified that CARB, the California Energy Commission (CEC), the Public Utilities Commission, and other relevant agencies worked with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to accommodate zero-emissions vehicles in major metropolitan areas, including infrastructure to support them (e.g., electric vehicle charging stations). The executive order also directs the number of zero-emission vehicles in California's state vehicle fleet to increase through the normal course of fleet replacement so that at least 10 percent of fleet purchases of light-duty vehicles are zero-emission by 2015 and at least 25 percent by 2020. The executive order also establishes a target for the transportation sector of reducing GHG emissions from the transportation sector 80 percent below 1990 levels.

Senate Bills 1078, 107, X1-2, and Executive Order S-14-08

A major component of California's Renewable Energy Program is the renewable portfolio standard (RPS) established under Senate Bills 1078 (Sher) and 107 (Simitian). Under the RPS, certain retail sellers of electricity were required to increase the amount of renewable energy each year by at least 1 percent in order to reach at least 20 percent by December 30, 2010. Executive Order S-14-08 was signed in November 2008, which expands the state's renewable energy standard to 33 percent renewable power by 2020. This standard was adopted by the legislature in 2011 (SBX1-2). Renewable sources of electricity include wind, small hydropower, solar, geothermal, biomass, and biogas. The increase in renewable sources for electricity production will decrease indirect GHG emissions from development projects, because electricity production from renewable sources is generally considered carbon neutral.

SENATE BILL 350

Senate Bill 350 (de Leon), was signed into law September 2015. SB 350 establishes tiered increases to the RPS of 40 percent by 2024, 45 percent by 2027, and 50 percent by 2030. SB 350 also set a new goal to double the energy efficiency savings in electricity and natural gas through energy efficiency and conservation measures.

California Building Standards Code – Building Energy Efficiency Standards

Energy conservation standards for new residential and non-residential buildings were adopted by the California Energy Resources Conservation and Development Commission (now the CEC) in June 1977 and most recently revised in 2016 (Title 24, Part 6, of the California Code of Regulations [CCR]). Title 24 requires the design of building shells and building components to conserve energy. The standards are updated periodically to allow for consideration and possible incorporation of new energy efficiency technologies and methods. On June 10, 2015, the CEC adopted the 2016 Building Energy Efficiency Standards, which went into effect on January 1, 2017.

The 2016 Standards continues to improve upon the previous 2013 Standards for new construction of, and additions and alterations to, residential and nonresidential buildings. Under the 2016 Standards, residential and nonresidential buildings are 28 and 5 percent more energy efficient than the 2013 Standards, respectively

(CEC 2015a). Buildings that are constructed in accordance with the 2013 Building Energy Efficiency Standards are 25 percent (residential) to 30 percent (nonresidential) more energy efficient than the prior 2008 standards as a result of better windows, insulation, lighting, ventilation systems, and other features. While the 2016 standards do not achieve zero net energy, they do get very close to the state's goal and make important steps toward changing residential building practices in California. The 2019 standards will take the final step to achieve zero net energy for newly constructed residential buildings throughout California (CEC 2015b).

California Green Building Standards Code – CALGreen

On July 17, 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11, Title 24, known as "CALGreen") was adopted as part of the California Building Standards Code (Title 24, CCR). CALGreen established planning and design standards for sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and internal air contaminants.[12] The mandatory provisions of the California Green Building Code Standards became effective January 1, 2011, and were last updated in 2016. The 2016 Standards became effective on January 1, 2017.

2006 Appliance Efficiency Regulations

The 2006 Appliance Efficiency Regulations (Title 20, CCR Sections 1601 through 1608) were adopted by the California Energy Commission on October 11, 2006, and approved by the California Office of Administrative Law on December 14, 2006. The regulations include standards for both federally regulated appliances and non-federally regulated appliances. Though these regulations are now often viewed as "business-as-usual," they exceed the standards imposed by all other states and they reduce GHG emissions by reducing energy demand.

Solid Waste Regulations

California's Integrated Waste Management Act of 1989 (AB 939, Public Resources Code 40050 et seq.) set a requirement for cities and counties throughout the state to divert 50 percent of all solid waste from landfills by January 1, 2000, through source reduction, recycling, and composting. In 2008, the requirements were modified to reflect a per capita requirement rather than tonnage. To help achieve this, the act requires that each city and county prepare and submit a source reduction and recycling element. AB 939 also established the goal for all California counties to provide at least 15 years of ongoing landfill capacity.

AB 341 (Chapter 476, Statutes of 2011) increased the statewide goal for waste diversion to 75 percent by 2020 and requires recycling of waste from commercial and multifamily residential land uses.

The California Solid Waste Reuse and Recycling Access Act (AB 1327, California Public Resources Code §§ 42900 et seq.) requires areas to be set aside for collecting and loading recyclable materials in development projects. The act required the California Integrated Waste Management Board to develop a model ordinance for adoption by any local agency requiring adequate areas for collection and loading of recyclable materials as part of development projects. Local agencies are required to adopt the model or an ordinance of their own.

[12] The green building standards became mandatory in the 2010 edition of the code.

Section 5.408 of the 2013 California Green Building Standards Code also requires that at least 50 percent of the nonhazardous construction and demolition waste from nonresidential construction operations be recycled and/or salvaged for reuse.

In October of 2014 Governor Brown signed AB 1826 requiring businesses to recycle their organic waste on and after April 1, 2016, depending on the amount of waste they generate per week. This law also requires that on and after January 1, 2016, local jurisdictions across the state implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units. Organic waste means food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste.

Water Efficiency Regulations

The 20x2020 Water Conservation Plan was issued by the Department of Water Resources (DWR) in 2010 pursuant to Senate Bill 7, which was adopted during the 7th Extraordinary Session of 2009–2010 and therefore dubbed "SBX7-7." SBX7-7 mandated urban water conservation and authorized the DWR to prepare a plan implementing urban water conservation requirements (20x2020 Water Conservation Plan). In addition, it required agricultural water providers to prepare agricultural water management plans, measure water deliveries to customers, and implement other efficiency measures. SBX7-7 requires urban water providers to adopt a water conservation target of 20 percent reduction in urban per capita water use by 2020 compared to 2005 baseline use.

The Water Conservation in Landscaping Act of 2006 (AB 1881) requires local agencies to adopt the updated DWR model ordinance or equivalent. AB 1881 also requires the Energy Commission, in consultation with the department, to adopt, by regulation, performance standards and labeling requirements for landscape irrigation equipment, including irrigation controllers, moisture sensors, emission devices, and valves to reduce the wasteful, uneconomic, inefficient, or unnecessary consumption of energy or water.

Thresholds of Significance

The CEQA Guidelines recommend that a lead agency consider the following when assessing the significance of impacts from GHG emissions on the environment:

1. The extent to which the project may increase (or reduce) GHG emissions as compared to the existing environmental setting;

2. Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project;

3. The extent to which the project complies with regulations or requirements adopted to implement an adopted statewide, regional, or local plan for the reduction or mitigation of GHG emissions.[13]

[13] The Governor's Office of Planning and Research recommendations include a requirement that such a plan must be adopted through a public review process and include specific requirements that reduce or mitigate the project's incremental contribution of GHG emissions. If there is substantial

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

To provide guidance to local lead agencies on determining significance for GHG emissions in their CEQA documents, SCAQMD has convened a GHG CEQA Significance Threshold Working Group (Working Group). Based on the last Working Group meeting (Meeting No. 15) held in September 2010, SCAQMD is proposing to adopt a tiered approach for evaluating GHG emissions for development projects where SCAQMD is not the lead agency (SCAQMD 2010):

- **Tier 1.** If a project is exempt from CEQA, project-level and cumulative GHG emissions are less than significant.

- **Tier 2.** If the project complies with a GHG emissions reduction plan or mitigation program that avoids or substantially reduces GHG emissions in the project's geographic area (i.e., city or county), project-level and cumulative GHG emissions are less than significant.

- **Tier 3.** If GHG emissions are less than the screening-level threshold, project-level and cumulative GHG emissions are less than significant.

For projects that are not exempt or where no qualifying GHG reduction plans are directly applicable, SCAQMD requires an assessment of GHG emissions. SCAQMD is proposing a screening-level threshold of 3,000 $MTCO_2e$ annually for all land use types or the following land-use-specific thresholds: 1,400 $MTCO_2e$ for commercial projects, 3,500 $MTCO_2e$ for residential projects, or 3,000 $MTCO_2e$ for mixed-use projects. These bright-line thresholds are based on a review of the Governor's Office of Planning and Research database of CEQA projects. Based on their review of 711 CEQA projects, 90 percent of CEQA projects would exceed the bright-line thresholds identified above. Therefore, projects that do not exceed the bright-line threshold would have a nominal, and therefore, less than cumulatively considerable impact on GHG emissions:

- **Tier 4.** If emissions exceed the screening threshold, a more detailed review of the project's GHG emissions is warranted.

The SCAQMD Working Group has identified an efficiency target for projects that exceed the screening threshold of 4.8 $MTCO_2e$ per year per service population ($MTCO_2e$/year/SP) for project-level analyses and 6.6 $MTCO_2e$/year/SP for plan level projects (e.g., program-level projects such as general plans) for the year 2020.[14] The per capita efficiency targets are based on the AB 32 GHG reduction target and 2020 GHG emissions inventory prepared for CARB's 2008 Scoping Plan.[15]

evidence that the possible effects of a particular project are still cumulatively considerable, notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

[14] It should be noted that the Working Group also considered efficiency targets for 2035 for the first time in this Working Group meeting.

[15] SCAQMD took the 2020 statewide GHG reduction target for land use only GHG emissions sectors and divided it by the 2020 statewide employment for the land use sectors to derive a per capita GHG efficiency metric that coincides with the GHG reduction targets of AB 32 for year 2020.

For the purpose of this project, SCAQMD's project-level thresholds of 3,000 $MTCO_2e$ and 4.8 $MTCO_2e$/year/SP are used. If projects exceed the bright line and per capita efficiency targets, GHG emissions would be considered potentially significant in the absence of mitigation measures.

Life cycle emissions are not included in this analysis because not enough information is available for the proposed project, and therefore life cycle GHG emissions would be speculative.[16] Black carbon emissions are not included in the GHG analysis because CARB does not include this pollutant in the state's AB 32 inventory and treats this short-lived climate pollutant separately.[17]

[16] Life cycle emissions include indirect emissions associated with materials manufacture. However, these indirect emissions involve numerous parties, each of which is responsible for GHG emissions of their particular activity. The California Resources Agency, in adopting the CEQA Guidelines Amendments on GHG emissions found that lifecycle analyses was not warranted for project-specific CEQA analysis in most situations, for a variety of reasons, including lack of control over some sources, and the possibility of double-counting emissions (see Final Statement of Reasons for Regulatory Action, December 2009). Because the amount of materials consumed during the operation or construction of the proposed project is not known, the origin of the raw materials purchased is not known, and manufacturing information for those raw materials are also not known, calculation of life cycle emissions would be speculative. A life-cycle analysis is not warranted (OPR 2008).

[17] Particulate matter emissions, which include black carbon, are analyzed in Section 5.2, *Air Quality*. Black carbon emissions have sharply declined due to efforts to reduce on-road and off-road vehicle emissions, especially diesel particulate matter. The State's existing air quality policies will virtually eliminate black carbon emissions from on-road diesel engines within 10 years (CARB 2017c).

CalEEMod Land Use Inputs: Proposed Project

Project Location:	12431 Roscoe Boulevard, City of Los Angeles in the San Fernando Valley
Climate Zone:	12
Operation Year	2022
Land Use Setting	Urban
Utility Company	LADWP
Source Receptor Area:	7 - East San Fernando Valley

Total Acreage:	37.2
Disturbed Acreage:	13.47

Type	Land Use Type	Land Use Unit Amount	Land Use Size Metric	Lot Acreage	Land Use Square Feet
Phase 1					
Education	High School	134.33	1000bsf	3.08	134,334
				3.08	
Phase 2					
Education	High School	176.43	1000bsf	4.05	176,427
Parking	Parking Lot	275.945	1000bsf	6.33	275,945
				10.39	

New Land Uses/Development*

Phase 1		
Building B Auditotium	*26,801*	building square feet (BSF)
Building C Food Service and Maintenance	*15,521*	
Lunch Shelter	*5,000*	
Building D Gymnasium	*42,667*	
Building E Library	*13,900*	
Building Subtotal	***103,889***	
Phase 2		
Building A Administration	***71,036***	BSF
Basketball Courts	*47,820*	
Tennis Courts	*29,005*	
*Parking A Restriping***	*121,251*	SF
*Parking C Restriping***	52,788	SF
*Parking B Restriping***	25,081	SF
Asphalt Subtotal	**275,945**	**SF**

**Based in information provided by the District.*

***sqft based on aerial photograph*

Renovation/Modernization*

Phase 1 Repaint	
Building 49	*43*
Building 50	*1,125*
Building 55	*849*
Building 56	*360*
Building 59	*21,090*
Building 37	*500*
Building 40	*2,300*
Building 41	*1,400*
Building 42	*280*
Building 43	*240*
Building 76	*2,258*
Total	***30,445***

Phase 2 Repaint and Re-roof	
Building 4	13,732
Building 5	12,072
Building 6	9,753
Building 7	9,110
Building 8	8,619
Building 12	*4,542*
Building 25	*8,212*
Building 26	*9,441*
Building 27	*9,624*
Buildings 28, 29	*13,416*
Building 30	*6,870*
Total	***105,391***

**Based in information provided by the District.*

Demolition

Phase 1		
Asphalt		
*Asphalt to be demolished:**	948.7	tons
Asphalt debris to be hauled offiste:	**948.7**	**tons**
1-way haul distance	20.0	miles (CalEEMod default)
*Haul truck capacity***	12.64	tons
*Haul Duration****	44	days
Total Haul Trips	150	trip ends
Daily Haul Trips	3	trip ends/day

**Based on measurement using Google Earth of areas anticipated to be demolished.*
***Based on 10 CY capacity haul truck per District and conversion factor of 1.2641662 tons/CY per CalEEMod methodology.*
****Based on information provided by District.*

Building		
Building Amount Demolition Volume:	103,662	building square feet
Building Demolition Debris Amount:*	**4,768**	**tons**
1-way haul distance	20.0	miles (CalEEMod default)
*Haul truck capacity***	12.64	tons
*Haul Duration****	44	days
Total Haul Trips	754	trip ends
Daily Haul Trips	17	trip ends/day
Total Haul Amount	**5,717**	tons
Total Haul Trips	904	trip ends (CalEEMod Default)
1-way haul distance	20	miles (CalEEMod Default)
Haul truck capacity	12.64	tons

**Based on CalEEMod conversion factor of 0.046 ton per square feet of building material.*
***Based on 10 CY capacity haul truck per District and conversion factor of 1.2641662 tons/CY per CalEEMod methodology.*
****Based on information provided by District.*

Phase 2		
Asphalt		
*Asphalt to be demolished:**	913.8	tons
Asphalt debris to be hauled offiste:	**913.8**	tons
1-way haul distance	20.0	miles (CalEEMod default)
*Haul truck capacity***	12.64	tons
*Haul Duration****	43	days
Total Haul Trips	145	trip ends
Daily Haul Trips	3	trip ends/day

**Based on measurement using Google Earth of areas anticipated to be demolished.*

Building		
*Building Amount Demolition Volume:**	99,895	BSF
Building Demolition Debris Amount:	**4,595**	**tons**
1-way haul distance	20.0	miles (CalEEMod default)
*Haul truck capacity***	12.64	tons
*Haul Duration****	43	days
Total Haul Trips	727	trip ends
Daily Haul Trips	17	trip ends/day
Total Haul Amount	**5,509**	tons
Total Haul Trips	872	trip ends (CalEEMod Default)
1-way haul distance	20	miles (CalEEMod Default)
*Haul truck capacity****	12.64	tons (CalEEMod default)

**Based on information provided by District.*
***Based on CalEEMod conversion factor of 0.046 ton per square feet of building material.*
***Based on 10 CY capacity haul truck per District and conversion factor of 1.2641662 tons/CY per CalEEMod methodology.*

Intallation and Removal of Portables*

Phase 1		
Buildings		
Number of Current Portables Removed	0	units
*Total Demolished Classrooms***	28	units
Number of Temporary Portables Installed	28	units
Total Removal + Installation Haul Trips	56	trip ends
Duration	44	work days
Daily Haul Trips	1	trip ends/day
1-way haul distance	20	miles

**Based on information provided by the District.*
***Calculated using Table 2*

Soil Haul*

Soil Export Amount	11,025	cubic yards
Total Haul Trips	1,575	trip ends
Daily Haul Trips	35	trips ends/day
1-way haul distance	20	miles (CalEEMod Default)
*Haul truck capacity***	14	CY
Haul Duration	45	days

*Based in information provided by the District.
**Per District.

Phase 2		
Buildings		
Number of Temporary Portables Removed	28	units
Total Haul Trips	56	trip ends
Duration	45	work days
Daily Haul Trips	1	trip ends per day
1-way haul distance	20	miles

*Based on information provided by the District.

Soil Haul*

Soil Export Amount	10,535	cubic yards
Total Haul Trips	1,505	trip ends
Daily Haul Trips	35	trips ends/day
1-way haul distance	20	miles (CalEEMod Default)
*Haul truck capacity***	14	CY
Haul Duration	43	days

*Based in information provided by the District.
**Per District.

Construction Trips

Building Construction Phase		
*Worker Trip Rate:**	0.42	trip/KSF
*Vendor Trip Rate:**	0.1639	trip/KSF

Development Phase	Worker Trip	Vendor Trip
Phase 1		
New Buildings	44	17
Renovated Buildings	13	5
Phase 2		
New Buildings	30	12
Renovated Buildings	44	17

*CalEEMod Version 2016.3.1 Users Guide, Appendix A.

Architectural Coating

	Building*
Percentage of Exterior Painted:	100%
Percentage of Interior Painted:	100%

*Assumes 100 percent of exterior and interior paintable areas would be coated.

*Non-Residential Interior Paint VOC content:**	50	grams per liter
*Non-Residential Exterior Paint VOC content:**	100	grams per liter
*Parking Paint VOC content :**	100	grams per liter
*Parking Paint VOC content:**	100	grams per liter

*Based on SCAQMD Rule 1113.
*Based on SCAQMD Rule 1113.

Land Use	Land Use Amount	CalEEMod Paintable Surface Area Multiplier*	Total Paintable Surface Area (BSF)	Total Paintable Interior Surface Area (BSF)*	Total Paintable Exterior Surface Area (BSF)*
Phase 1					
High School	134,334	2.0	268,668	201,501	67,167
			Subtotal:	***201,501***	***67,167***
Phase 2					
High School	176,427	2.0	352,854	264,641	88,214
			Subtotal:	***264,641***	***88,214***
Parking Lot	275,945	0.06	16,557	0	**16,557**

**Based on CalEEMod methodology in calculating the paintable surface areas for a nonresidential building and surface parking lot.*

Construction Phasing: Phase 1*

5-Day Work Week

18 Month Construction Schedule

		Buildout Duration	18	months
Phase Name	**Start Date**	**End Date**	**Workdays**	**Total Days**
Demolition	1/1/2019	3/2/2019	44	60
Building Construction - Portables Installation	1/15/2019	3/16/2019	44	60
Site Preparation/Grading	3/4/2019	5/3/2019	45	60

Asphalt Paving						**30**	**18**
Skip loader	Tractors/Loaders/Backhoes	**2**	8	**97**	**0.37**		
Roller	Roller	**1**	8	**80**	**0.38**		
Paver	Paver	**1**	8	**130**	**0.42**		
Asphalt Trucks[5]	Cement and Mortar Mixers	**8**	8	**9**	**0.56**		**16**
Water Truck		**1**					**2**
Temporary Portables Removal						**0**	**0**
Crane	Crane	**1**	8	**231**	**0.29**		
Phase 2 Haul Truck[4]							**56**

[1] Utilizes CalEEMod default values.

[2] Assumes 2 trips per water truck per day.

[3] Utilizes cement and mortar mixers and assumes 2 truck trips per truck per day to capture emissions from operation of cement trucks.

[4] Associated with hauling of the temporary portable classroom buildings.

[5] Utilizes cement and mortar mixers and assumes 2 truck trips per truck per day to capture emissions from operation of asphalt trucks.

Pavement Volume to Weight Conversion

Phase I Location	Total SF of Area[1]	Assumed Thickness (foot)[2]	Debris Volume (cu. ft)	Weight of Crushed Asphalt (lbs/cf)2	AC Mass (lbs)	AC Mass (tons)
Tennis Courts	25,086	0.33	8,362	45	376,290	188.15

Poly High School Phase 2

Los Angeles-South Coast County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
High School	176.43	1000sqft	4.05	176,430.00	0
Other Asphalt Surfaces	275.94	1000sqft	6.33	275,945.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	12			**Operational Year**	2022
Utility Company	Los Angeles Department of Water & Power				
CO2 Intensity (lb/MWhr)	1227.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

Poly High School Phase 2

Los Angeles-South Coast County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
High School	176.43	1000sqft	4.05	176,430.00	0
Other Asphalt Surfaces	275.94	1000sqft	6.33	275,945.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	12			**Operational Year**	2022
Utility Company	Los Angeles Department of Water & Power				
CO2 Intensity (lb/MWhr)	1227.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

INTRODUCTION

EXECUTIVE SUMMARY

LAUSD intends to undertake a comprehensive modernization project at John H. Francis Polytechnic High School that includes demolition, new construction, limited modernization and off-site utility improvements. The project proposes to remove existing structures and landscape that will impact existing tree resources.

The campus is located near an industrial area and adjacent to a busy freeway. It is recommended that canopy cover be increased as feasible for the health and comfort of both students and staff.

Healthy tree canopy in urban environments have multiple benefits[1]:

- INCREASE PERSONAL COMFORT. Average temperatures have risen 6 degrees F in the last 50 years. Trees directly improve air quality by reducing air temperature, blocking intense sun during the heat of the day, removing air pollutants and releasing cooling water vapor from their leaves.
- CLIMATE CHANGE MITIGATION. Trees reduce carbon in the atmosphere by holding carbon in their roots, stems and branches while releasing oxygen into the air. One acre of mature trees can absorb the amount of carbon released when you drive a car 26, 000 miles.
- DECREASE ENERGY CONSUMPTION. Shade building and paved surfaces thereby reducing energy usage. Trees can cool an area by up to 10 degrees F.
- IMPROVED QUALITY OF LIFE. Large mature trees can have a calming effect on children, provide habitat for wildlife, improve property values, and provide screening for privacy.
- PROTECT CHILDREN FROM SUNBURN. Trees can reduce sun exposure from UV-B radiation by about 50%.
- CAPTURE AND SAVE WATER. Large canopy trees can intercept rainfall and slowly allow it to percolate into the ground, reducing runoff into the storm drains and naturally recharging the groundwater table.

[1] Condensed from Top 22 Benefits of Trees at Tree people website at https://www.treepeople.org/resources/tree-benefits?gclid=CNmwh6yCgM4CFQtsfgodWKMBRw

ASSIGNMENT AND SUMMARIZED RESULTS

Rebecca Latta Consulting was retained to survey and assess all trees at Francis Polytechnic (PHS) and perform a conceptual tree impact assessment for proposed improvements. Each tree is tagged and measured. Tree locations and canopy are shown in the existing tree survey map. Then the concept map was layered with the existing tree map to create a preliminary tree impact map.

TREE IMPACTS SUMMARY TABLE	
Remove - Health/Structure	6
Remove - Construction conflicts/impacts	65
Neutral	67
Preserve	193
LA City Protected	2
Total	333

Based on our analysis of the conceptual plans, 65 trees on campus are may require removal for construction conflicts/impacts. An additional 6 trees are recommended for removal due to poor health and/or structure. **In total, 71 trees are recommended for removal.**

Currently 67 trees are listed as "Neutral". These trees appear healthy enough to survive low to moderate construction impacts. However, some trees may need root pruning to achieve desired grade. Installation of pavers and grading may require excavation and compaction of subgrade that would significantly impact tree roots. These impacts may increase the number of "Neutral" trees to be removed for the project.

The 193 trees listed as "Preserve" refer to trees with no anticipated construction impacts. These trees are recommended for preservation.

TREE SURVEY OVERVIEW

A total of 333 trees were surveyed on campus, 2 of which are protected trees: a coast live oak (*Quercus agrifolia*) by the track in the north corner of the school and an Oregon white oak (*Quercus garryana*) in the Senior Glade in the east corner of the school. 70 protected street trees adjacent to the campus were also surveyed.

There are at least 67 tree species on campus, of which the 20 most common are:

Common name	Tree Species	Count
Arizona ash	*Fraxinus velutina*	39
Mexican fan palm	*Washingtonia robusta*	38
Carrotwood	*Cupaniopsis anacardioides*	26
Olive	*Olea europaea*	22
Tipu tree	*Tipuana tipu*	20
Brazilian pepper tree	*Schinus terebinthifolius*	18
Canary Island pine	*Pinus canariensis*	13
Evergreen ash	*Fraxinus uhdei*	10
Chinese windmill palm	*Trachycarpus fortunei*	10
Lemon-scented gum	*Corymbia citriodora*	9
Queen palm	*Syagrus romanzoffianum*	8
Juniper	*Juniper chinensis*	7
Canary Island date palm	*Phoenix canariensis*	7
Costa Rican holly	*Olmediella betschleriana*	6
Lemon bottlebrush	*Callistemon citrinus*	5
Weeping bottlebrush	*Callistemon viminalis*	5
White mulberry	*Morus alba*	5
Aleppo pine	*Pinus halepensis*	5
Red ironbark	*Eucalyptus sideroxylon*	4
Southern magnolia	*Magnolia grandifolia*	4

There are 70 street trees that were also surveyed for the project. Three of the street trees were dead. 14 sites were vacant.

Common name	Tree Species	Count
Jacaranda	*Jacaranda mimosifolia*	34
Silk Tree	*Albizzia julibrissin*	27
Hong Kong Orchid	*Phaenera purpurea*	6
Dead		3
Total	**Street Trees**	**70**

PROTECTED TREES

According to the City of Los Angeles Protected Tree Ordinance No. 177404, any of the following Southern California native tree species, measuring at least 4 inches in cumulative diameter at 4.5 feet above grade (DBH) are protected:

(a) Any tree of the oak genus indigenous to California but excluding the scrub oak (*Quercus dumosa*)

(b) Southern California black walnut (*Juglans californica var. californica*)

(c) Western sycamore (*Platanus racemosa*)

(d) California Bay (*Umbellularia californica*)

METHODS

The trees were surveyed on May 15, 17, 22, 23, and 24, 2017. Our office conducted a basic visual assessment[2] for each tree affected by the project. Trees were measured at 54 inches from grade with a diameter tape using the American Forest Tree Measuring Guidelines. Canopies were measured in 4 cardinal directions and drawn on the site plans.

Each tree was assessed for defects such as depressions, nesting holes, structural defects, cavities, wounds, cracking bark, sap flow, insect damage, and deadwood. The inspection was conducted during daylight hours, under good weather conditions, and in light sufficient for detecting details such as surface decay and leaf color. The influence of adjacent trees and other factors affecting the growth of a subject tree, such as wires, cables, or nesting holes, were also taken into consideration when assessing tree condition.

[2] A basic visual assessment is a 360-degree inspection from the ground that includes collection of height and diameter measurements. Trees are assessed for structure. Binoculars may be used for a crown inspection, a mallet for sounding hollows, a probe for inspecting cavities, and other tools as needed to determine structural, disease or insect issues.

SURVEY RESULTS AND IMPACT ANALYSIS

TREE HEALTH GUIDELINES

A subjective alphabetical rating (e.g., "A" = best and "F" = worst) was assigned to rank the overall health of the tree(s). This rating is based on the aesthetic, structural and biological functions of the trees. Health ratings are defined as follows:

A – Excellent: Overall healthy appearance with good vigor, shoot growth, leaf color and size, minimal or no disease or insect infestation, no buried crowns (the area where roots join the stem was not covered with soil), good callus tissue formation, and limited or no fire damage.

B – Good: Less than 25% of overall health of tree affected by disease, stress, decay, insect infestation, or fire damage. Tree can have minor correctable defects that could be addressed with pruning or root crown excavations.

C – Fair: Between 25% and 50% of tree significantly affected by disease, stress, decay, insect infestation, or fire damage. Tree can have thinning canopy, circling or poorly developed roots, sunburned bark and borer damage. Tree may have defects, including internal wood decay, insect infestations, and root decay.

D – Struggling: More than 50% of overall health of tree affected by disease, stress, decay, insect infestation, or fire damage. In older trees, significant wood decay may be present.

F – Dead: Exhibits no signs of life or is not expected to recover.

SPECIFIC TREE REMOVAL RECOMMENDATIONS

The following trees have significant structural or health issues and are recommended for removal. Some of the following trees are also recommended for removal due to construction conflicts/impacts.

A. Tree #4: Brazilian Pepper Tree

This 23-inch diameter tree is located by the music building. The tree is in a permanent state of decline with a very thin canopy, severe trunk damage and decay, and a history of failure. Tree health rates a "D" on an A-F scale. Removal is recommended in 30 to 60 days.

B. Tree #20: Olive

This multi-trunked tree is located just north of the auditorium building. The tree is in a permanent state of decline with crown dieback, very little live wood, and a very thin canopy. Tree health rates a "D" on an A-F scale.

C. Tree #32: Costa Rican holly

This 1- inch diameter tree is located just east of the auditorium building. The tree's structure is severely compromised with live wood on 40% of trunk circumference. Tree health rates a "C+" on an A-F scale.

D. Tree #89: Arizona ash

This 12.5-inch diameter tree is located between buildings K and M. The tree has a very weak structure with a large cavity between severely codominant main branches. Tree health rates a "B-" on an A-F scale.

E. Tree #121: Persian silk tree

This 5.5-inch diameter tree is located by the driveway gate in the south portion of the agricultural area. The leaning tree has a damaged trunk and crown dieback. Tree health rates a "C" on an A-F scale.

F. Tree #158: Pine tree

This 18-inch diameter tree is located in the senior glade. The tree is in decline. Tree health rates a "D-" on an A-F scale.

G. Tree #173: Carrotwood

This 20-inch diameter tree is located in the senior glade. Tree structure is weak with extensive heartwood rot (Ganoderma applanatum) with conks at its base. Tree health rates a "B" on an A-F scale. Even though the leaves are green, the tree has potential for trunk failure.

H. Tree #211: Olive

This multi-trunked tree is located between the administration building and the library building. The tree is in a permanent state of decline with crown dieback, a very thin canopy, and poor structure. Tree health rates a "D+" on an A-F scale.

I. Tree #229: Brazilian pepper tree

This 18-inch diameter tree is located by the visitor parking lot entrance on Arleta Avenue. The tree is in a permanent state of decline with decay, split branches, and a very thin canopy. Tree health rates a "D+" on an A-F scale.

J. Tree #250: Brazilian pepper tree

This 16-inch diameter tree is located by the cafeteria. The tree is in a permanent state of decline with decay, a very thin canopy, and poor structure. Tree health rates a "D+" on an A-F scale.

K. Tree #251: Olive

This multi-trunked tree is located in the "polygon" just south of the cafeteria. The tree is in a permanent state of decline with decay, chlorotic leaves, and a very thin canopy. Tree health rates a "D+" on an A-F rating scale.

L. Tree #255: Olive

This multi-trunked tree is located in the west corner of the "polygon". The tree is in a permanent state of decline with epicormic shoots, a very thin canopy, and poor structure. Tree health rates a "D+" on an A-F rating scale.

TREE HEALTH AND STRUCTURE ISSUES

STRUCTURAL CONCERNS

ARIZONA ASH

Arizona ash trees (*Fraxinus velutina*) are a dominant species on the campus and are concentrated in the walkways between classrooms. Several of the trees have significant structural defects such as decay, wood borer damage, and codominant (same size) branches and have likely had these defects for many years.

Codominant branches are often weakly attached and have decay between them. This can result in failures where the two branches or trunks split apart. These trees should be inspected annually because they are in high use areas, and trees in poor condition should be phased out and replaced with new trees as feasible.

STRUCTURAL DECAY

The survey found trees with external signs of decay. Where decay was seen, it is noted in the detailed results from the tree survey. Trees can tolerate large amounts of internal decay without being rendered hazardous. Where decay is found, it may be necessary to take actions to reduce the load in the canopy as directed by an arborist who understands the biomechanics of tree failures. Further monitoring is recommended for trees with decay on a yearly basis by a qualified consulting arborist trained in risk assessment.

Types of structural decay include, but are not limited to cracks and bark fissures, open cavities, bark inclusions (localized), sunken bark, wound wood, and crown symptoms (dieback). These symptoms were found on trees on the property.

SOIL CONDITIONS

Tree health is directly related to soil health. There are many trees on campus in areas with compacted soil, which can be detrimental to root health. Compared to healthy soil, compacted soil contains less pore space needed for oxygen exchange, and is more difficult for roots to penetrate. Compacted soils also reduce the rate of water infiltration.

Much of the soil is also deficient in organic matter. Organic matter helps reduce compaction, improve drainage, provide nutrients to roots, and encourage beneficial soil organisms. Surface Mulches such as bark chips encourage beneficial fungus (such as *Trichoderma spp*.), retain moisture, suppress weeds, and improve soil structure. Mulch, leaves or other organic material encourage earthworm and microbial activity. Earthworms aerate and 'rototill' the soil, bringing nutrients to the roots.

High pH and soil chemistry imbalances may lead to poor plant performance. Some of these problems can be remedied by testing the soil and making adjustments in the chemical composition of the soil. Flooding irrigation events can move salts and other soluble elements out of the root zone and improve tree health.

The school sits atop an old landfill which could release methane and carbon dioxide into the soil. Small releases of gas over time can lead to leaf necrosis, dieback, and tree decline as the gases displace oxygen needed by roots in the soil. Methane can replace oxygen in the soil and cause anaerobic (lacking in oxygen) soil conditions often indicated by dark, sticky and septic-smelling soil.

Soil Improvement Recommendations:

1. Obtain a soil fertility test for soil in specific areas of campus that are to be planted. A complete analysis with Ph, salts, micro- and macro-nutrients is recommended. If salts are in issue, flush soils with flooding irrigation events. Recheck soils to make sure that soil chemistry has improved.

2. Check percolation to make sure the soil drains at least .5 inches/hr. If it does not, then steps need to be taken to improve water infiltration.

3. Obtain a report with the water quality for the site. The soil will take on the characteristics of the applied water.

4. It is recommended that a 4-inch thick layer of minimum 2-inch diameter bark chips be placed under the entire dripline of trees as feasible. Keep the mulch at least 6 inches away from tree trunks. The mulch protects the soil from heat and preserves and encourages feeder root growth.

5. If the area is going to be adjacent new structures the soil often must be compacted for engineering purposes around the new improvements. If these are landscape areas for new planting with no existing trees, the soil should be cross-ripped and decompacted to at least 2-3 feet as feasible. This will make a significant difference for the success of any new plantings. Landscape plants prefer soil compaction rates no greater than 65 to 75%.

INSECT AND DISEASE DESCRIPTIONS

ARMORED SCALE (GREEDY SCALE) - INSECT

These scale insects were found on the street trees and on-campus trees adjacent to the street. The plants may appear water stressed or drop leaves prematurely. The scale produces a sticky excrement called sooty mold. The honeydew product excreted by the scale attracts ants who protect the scale from their natural predators. Ant control is critical to scale control. A well timed application of horticultural oil in the dormant season or when scale crawlers are active from winter to early summer is recommended.

COTTONY CUSHIONY SCALE *(ICERYA PURCHASI)*

This scale insect is also infesting the street. It is more mobile than also key to managing this insect. A beetle (Rodolia cardinalis) can be

Close up of Armored Scale

trees on the street and adjacent to the armored scale. Ant control is natural predator, the vedalia used to control populations.

Whitish area on bark is cottony cushiony scale

EUCALYPTUS TORTOISE BEETLE (*TRACHYMELA SLOANEI)*

The Tortoise beetle is one of several leaf beetles from Australia that causes widespread damage to Eucalyptus trees across California. Notched leaves are the symptom of this insect. Well maintained and watered trees are usually able to tolerate leaf feeding. If treatment is desired, contact a licensed pest control advisor/applicator.

HEARTWOOD ROT (*GANODERMA SPP.)* - DISEASE

Ganoderma fungus causes a white rot or butt rot of hardwood trees and shrubs. It is common in local oak species. The presence of fruiting bodies usually indicates an advanced level of decay in the wood. The spores can land on open pruning wounds or other damaged plant tissue. Fruiting bodies or conks usually develop near the soil line or in the lower trunk. There two common types in La Canada Flintridge; the 'Artist's Conk' and the 'Varnish Conk'.

Heartwood rot on Coast live oak

XYLELLA (BACTERIAL BLIGHT) – DISEASE INSECT COMPLEX

Xylella, or bacterial blight, is caused by the bacterium *Xylella fastidiosa*. The bacterium clogs vascular tissue, causing branches and shoots to die. Large branches often wilt and die while adjacent branches appear healthy. The disease is often transmitted from plant to plant by the glassy-winged sharpshooter (*Homalodisca vitripennis*), an invasive sap-sucking insect. Treatments are available to retard the insect's spread, but the bacterial disease is difficult to treat once it is in the tree. There are no effective treatments for this disease. Keep trees vigorous through good water management and healthy soil conditions. Trees infected with the disease may die prematurely.

TREE PROTECTION MEASURES

These recommendations were developed to minimize any preventable construction related damage to the trees. It is important to preserve soil structure and fertility by physically protecting the soil from compaction and other maintenance activities that destroy fine roots**. I recommend that these preservation notes be copied and pasted onto the site plans along with arborist contact information.**

PROTECTIVE FENCING

Prior to any further construction activity, protective fencing should be installed at the approved limit of work or the edge of the Tree Protection Zone for protected trees. The fencing should remain in place until construction is complete. *A MEETING IS RECOMMMENDED WITH THE PROJECT ARBORIST AND THE CONSTRUCTION TEAM TO DETERMINE FENCING LOCATIONS PRIOR TO CONSTRUCTION.*

1. Provide a minimum of ¾ inch thick plywood joined together with metal clips over any bare dirt in the root zone of protected trees in areas where equipment needs to pass or where there is heavy foot/car traffic. This is to prevent compaction damage to roots.

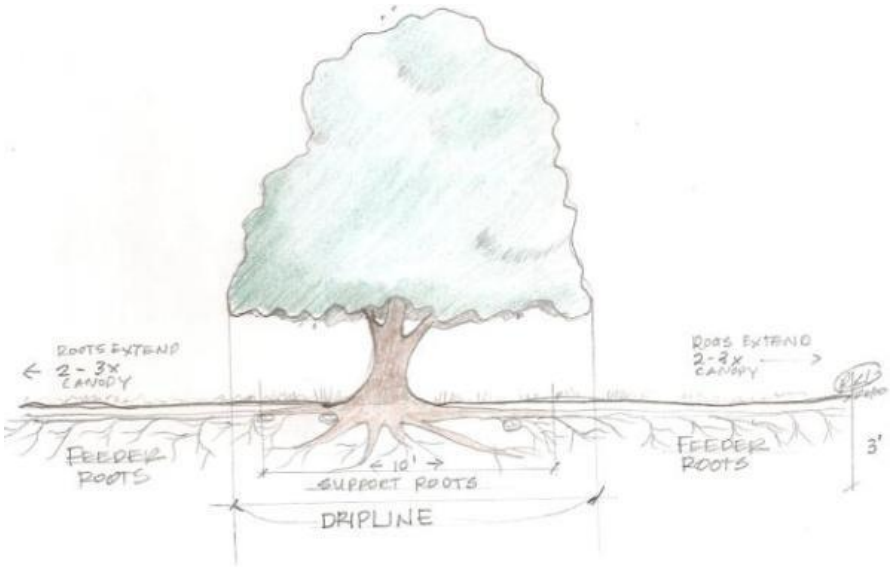
2. Avoid mechanical injury and compaction to roots, root flares, trunks and branches. Break and lift off asphalt and concrete by hand or using small equipment under the dripline of any tree to be retained. A qualified arborist is recommended to be present to observe the area with the roots exposed, prior to undertaking any root pruning or grading.

3. Staging areas should be established before construction for materials and equipment. Washout areas should be provided for paint/stucco and concrete or other substances to contain the chemicals. These chemicals can harm tree roots. The washout and staging areas should be outside of the protected zone of protected trees and dripline of trees to be retained. The purpose is to limit preventable compaction to tree roots. Compaction reduces soil air space and limits gas exchange required for healthy tree growth.

4. Equipment should not idle under the driplines of trees to be preserved. Significant burn can occur to leaves and bark from exhaust and heat.

5. The tree/root protection zone should be irrigated sufficiently with clean, potable water to keep the tree in good health and vigor before, during and after construction. Trees should be soaked so that water reaches a depth of 2 to 3 feet and then allowed to dry out between watering.

6. Mulch in the form of bark chips is recommended for application over the surface of the soil to 4 inches deep to preserve moisture and improve soil condition.



7. Trenching should occur prior to construction work to assess the impacts on the tree. This work is required to assess the size and volume of roots impacted by construction. Hand trench, keeping all roots 2” and greater intact.

8. If roots need to be cut it is recommended that the area be dug out and the roots cut back 1 to 2 inches behind the soil line. After the cut is made, recover the cut root with moist soil. The cut should be made with a sharpened, sterilized hand-pruning tool (not a chainsaw or sawzall).

    a. Roots should be pruned at the branch bark ridge, when possible. Indiscriminate cuts can cause vigorous resprouting toward hardscape.

    b. Extensive root loss can destabilize trees and cause them to go into decline. Removing large roots takes significant root mass and feeder roots. All root pruning is recommended for supervision by the project arborist.

    c. Wherever feasible, utility lines should be run outside the protected zone of trees. Any lines within the protected zone should be tunneled or run underneath existing roots rather than through them.

Tree root zone sketch

9. Trees should be pruned by qualified arborist using Best Management Pruning Practices (2008) part of ANZI A300 or equivalent. Trees should be inspected yearly and pruned as needed, not on a set schedule. More information is available at www.isa-arbor.com.

CAUTION: Removing too much foliage can weaken trees by depleting energy reserves and increasing susceptibility to insects and disease. Climbing spikes should not be used under any circumstances and are only acceptable for dead trees and climber rescue operations.

INSPECTION

Trees should be inspected on a periodic basis by a qualified tree consultant. The relative age, condition and targets under the tree should determine the inspection frequency. It is the responsibility of the property owner to establish and implement an appropriate inspection schedule based on the recommendation provided by a qualified arboricultural consultant.

Sincerely,

Rebecca Latta

Advisement:

The client is advised that should physical or biological concerns be evidenced for any specimen evaluated in a report, prudent further investigation, detailed analysis or remedial action may be required. Trees are living organisms that respond to environmental changes influencing the development, health and vigor of the specimen(s).

CERTIFICATE OF PERFORMANCE

I, Rebecca Latta certify that:

- I have personally inspected the trees described in this report and have accurately stated my findings. The extent of the evaluation is stated in the attached report;
- I have no current or future interest in the vegetation or the property that is the subject of the report and no bias with respect to the parties involved;
- The analysis, opinions, evaluation, investigation and conclusions have been prepared using accepted arboricultural practices;
- I performed the work myself and prepared the report and reviewed the report, except as specifically indicated in the report;
- That my compensation is not contingent upon the reporting of a predetermined conclusion that favors the cause of the client or any other party nor the results if the assignment, attainment of stipulated results or the occurrence of any subsequent events.
- I further state that I am a member in good standing with American Society of Consulting Arborists and the International Society of Arboriculture. I have been involved in the practice of arboriculture and the care and study of trees for 25 years.

Signed: Rebecca Latta Date: June 12, 2017

APPENDIX ‘A’

DETAILED TREE SURVEY RESULT

TREE TABLE ABBREVIATION

ANTHR = ANTHRACNOSE

ARMIL = ARMILLARIA ROOT ROT SUSPECTED

CANK = CANKER

CHLOR = CHLOROTIC

CIR ROOT = CIRCLING ROOTS

CODOM = CODOMINANT LEADERS*

CPT SOIL = COMPACTED SOIL

CR DB = CROWN DIEBACK

CRK = CRACK

DK = DECAY

DWD = DEADWOOD

EPI = EPICORMIC SHOOTS

FL CUT = FLUSH CUT

HANG = HANGER

LMD = LAWNMOWER OR TRIMMER DAMAGE

MUM = MADE UP MULTI (THE "MULTI-TRUNKED" TREE MAY BE SEPARATE TREES)

PSHB = POLYPHAGOUS SHOT HOLE BORER

PWR = POWER LINES

RE FAIL = RECENT BRANCH FAILURE

SCALE = SCALE INSECTS

SCORCH = SCORCHED NEEDLES OR FOLIAGE

SOOT = SOOTY MOLD

STRIP = LION'S TAILED, CENTER STRIPPED

SYC BOR = SYCAMORE BORER

TOP = TOPPED

TORT BEETLE = EUCALYPTUS TORTOISE BEETLE

TR BUR = TRUNK BURIED**

TR INJ = TRUNK INJURY

VER BR = VERTICAL BRANCHES

VERT = VERTICILLIUM WILT SUSPECTED

WEEP = WEEPING SAP

XYLE = XYLELLA BACTERIAL BLIGHT SUSPECTE

* Codominant leaders, or trunks, are equally sized and both act like the tree's central leader. Codominant leaders may be weakly attached to each other due to narrow branch angles and included bark.

** Trunk buried means excess soil covers the anchor roots and lower part of the trunk. Trees with buried trunks are more susceptible to opportunistic pathogens (diseases) such as oak root rot (*Armillaria mellea*) and Phytophthora root rot (*Phytophthora spp*.), especially when the soil is continually wet.

*** Permanent state of decline refers to a slow, progressive, and permanent deterioration in tree health and structure.

TREE SURVEY TABLE

Tree #	Common Name	Species	DBH* (in)	Health (A-F)	Height (ft)	Comments	Recommendations	Impact assessment
1	Brazilian pepper tree	*Schinus terebinthifolius*	23	B	25	CODOM, CPT SOIL, STUB, crossing branches, root sprouts, poor callus	Structural Prune	Remove - Construction conflicts/impacts

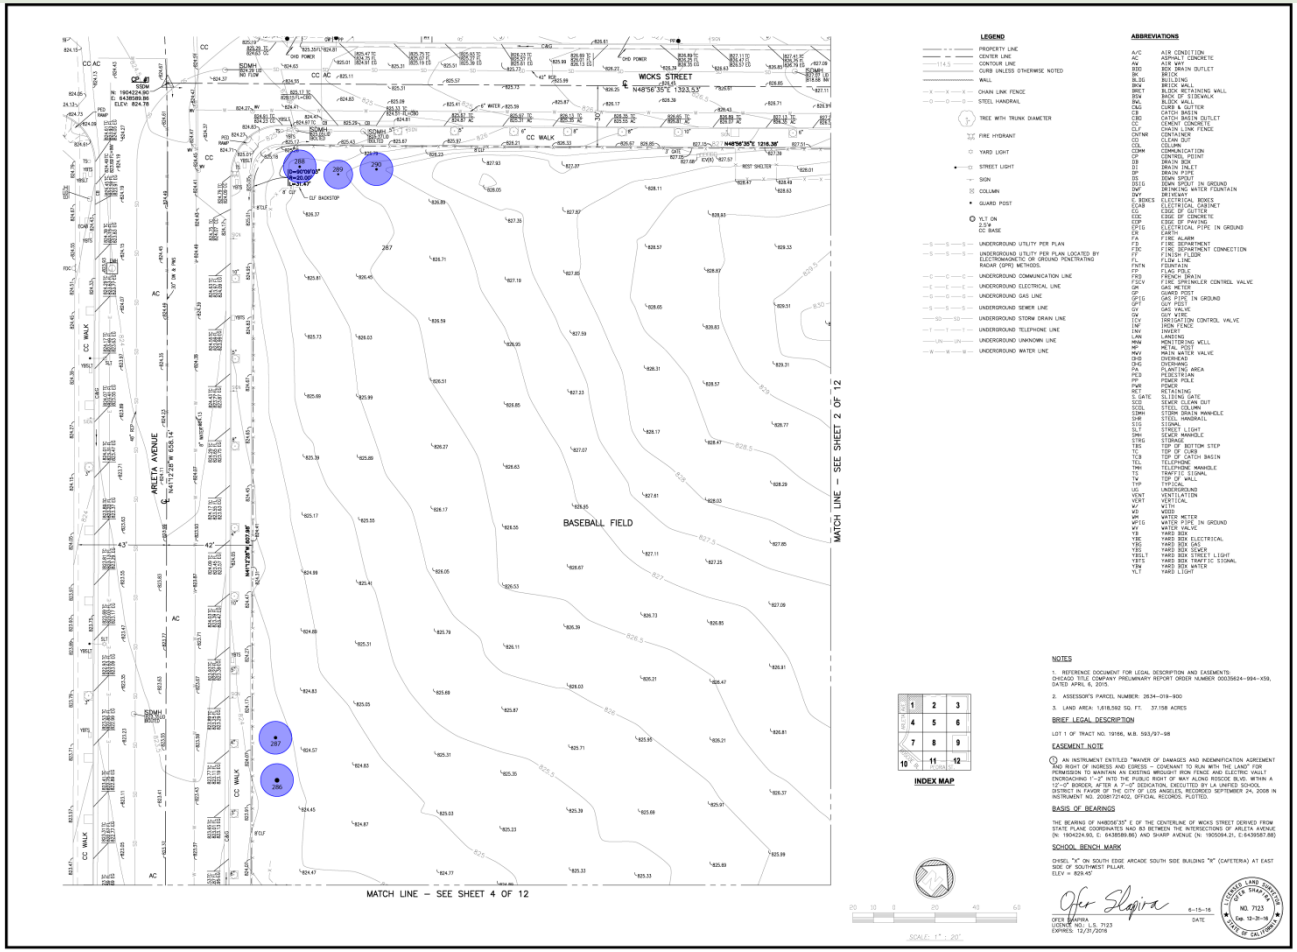
APPENDIX 'B'

EXISTING TREE SURVEY AND PRELIMINARY TREE IMPACT MAP



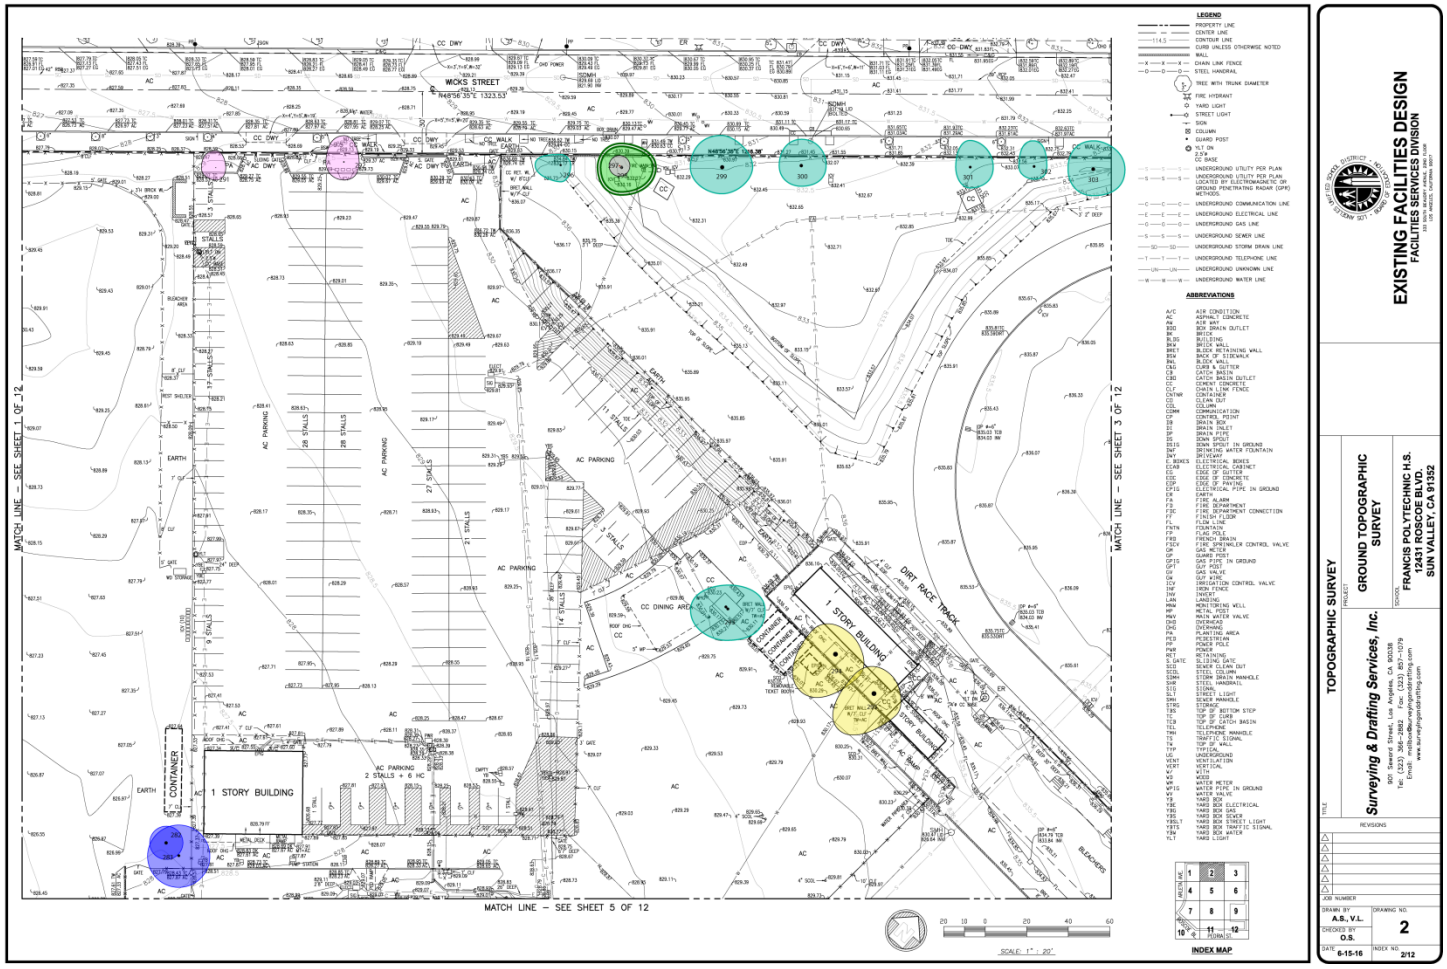
TREE SURVEY MAP (12 SHEETS TOTAL)

Tree Legend

- Protected oak trees (Indigenous *Quercus spp.*)
- Ash trees (*Fraxinus spp.*)
- Palm trees
- Carrot wood (*Cupaniopsis anacardioides*)
- Olive (*Olea europaea*)
- Tipu tree (*Tipuana tipu*)
- Eucalyptus and gum trees
- Brazilian pepper (*Schinus terebinthifolius*)
- Pine trees (*Pinus spp.*)
- Other trees

Francis Polytechnic Senior High School
Preliminary Tree Survey
Surveyed May 2017
Rebecca Latta Consulting

Note: trunk locations of trees on property are based on topographic survey by Surveying & Drafting Services, Inc. dated June 15, 2016. Trunk locations of trees not on the topographic survey are visually estimated and highlighted in red. Tree canopies are measured in the field and have not been professionally surveyed by civil surveyors.



Tree Legend

- Protected oak trees (Indigenous *Quercus spp.*)
- Ash trees (*Fraxinus spp.*)
- Palm trees
- Carrot wood (*Cupaniopsis anacardioides*)
- Olive (*Olea europaea*)
- Tipu tree (*Tipuana tipu*)
- Eucalyptus and gum trees
- Brazilian pepper (*Schinus terebinthifolius*)
- Pine trees (*Pinus spp.*)
- Other trees

EXECUTIVE SUMMARY

This report presents the results of a historic resources survey conducted for the Los Angeles Unified School District (LAUSD) by Sapphos Environmental, Inc. between October 2013 and February 2014. Debi Howell-Ardila, senior architectural historian, served as project manager, survey team lead, and principal author of the LAUSD Historic Resources Survey Report. Marilyn Novell, historic resources coordinator, contributed to fieldwork, research, data management, and documenting survey results on Department of Parks and Recreation forms. Carole Zellie, historic resources manager, provided oversight and input. All staff meet and/or exceed the Secretary of the Interior's Professional Qualifications Standards for architectural history. Gwenn Godek of the LAUSD Office of Environmental Health and Safety served as project administrator and manager.

This survey represents a first step in a district-wide historic resources survey of as-yet unevaluated LAUSD campuses and properties. The information compiled in this report, including the *LAUSD Historic Context Statement, 1870 to 1969*, is intended to provide the district with a basis for proactively identifying, documenting, and maintaining its historically significant school buildings and campuses in advance of district-wide redevelopment efforts.

Included in this survey were a total of 55 LAUSD campuses, which span the extent of the district (Figure 3, *Los Angeles Unified School District boundary*). At the time of the survey, all campuses were 45 years of age or older, with dates of construction ranging from the late 1940s through early 1970s; a majority had not been previously surveyed or evaluated. The survey sample included elementary, middle, and senior high schools, as well as several specialty facilities or campuses.

Of the 55 campuses surveyed, 14 campuses appear to be eligible for the National Register of Historic Places (NRHP) and/or the California Register of Historical Resources (CRHR). Eligible campuses are described in detail in Section 4, Survey Results, and documented on Department of Parks and Recreation (DPR) Primary and Building, Structure, and Object forms, which are included in Appendix A.

I. INTRODUCTION

With nearly 800 campuses and a geographic span of over 700 square miles, LAUSD is the second largest public school system in the United States. The district includes all of incorporated Los Angeles, as well as unincorporated areas throughout Los Angeles County. LAUSD's northern portion spans the San Fernando Valley, including Granada Hills, Chatsworth, Reseda, Woodland Hills, Van Nuys, Sylmar, San Fernando, Pacoima, and Sunland. Along the west, LAUSD includes western Los Angeles, Pacific Palisades, Venice, and Westchester. Along the east, LAUSD borders Glendale, Monterey Park, Montebello, Commerce, Downey, and Long Beach. Within LAUSD, extending south from Los Angeles, are the communities of Vernon, Huntington Park, Maywood, Bell, South Gate, Gardena, and Carson. LAUSD's southernmost portion includes San Pedro, Lomita, and Rancho Palos Verdes.

Since its founding in 1872, LAUSD has commissioned, designed, and acquired a remarkable collection of buildings, campuses, and facilities. These properties reflect more than a century of social, architectural, and technological advances, as well as ongoing educational and curricular reform. Extant properties range from a wood-framed schoolhouse of the late nineteenth century to superblock campuses displaying Mid-Century Modern architectural styles.

In the early 2000s, in conjunction with the Getty Conservation Institute, LAUSD launched the district's first comprehensive Historic Resources Survey. This work resulted in findings of federal and/or state eligibility for 123 schools (local eligibility criteria were not included in these surveys; public schools are statutorily exempt in the California State Government Code from local landmark designation).[1] With a project scope focused primarily on the pre–World War II era, however, many postwar campuses were either not surveyed or not subject to context-driven evaluations. Since the 2001–2004 surveys, approximately 175 additional campuses have passed the 45-year mark, signaling the need for future evaluation. Another approximately 125 campuses constructed between 1945 and 1955 have been evaluated only at the reconnaissance level, and only from the public right-of-way.[2]

Project Description and Purpose

In advance of campus-wide redevelopment, LAUSD contracted with Sapphos Environmental, Inc. to provide historic resource consulting services to inform master planning efforts and environmental review pursuant to the California Environmental Quality Act (CEQA). The scope of work is three-fold:

1. Preparation of a comprehensive LAUSD Historic Context Statement;
2. Historic resource surveys of 55 campuses; and
3. Updating the LAUSD Historic Resources Inventory database.

The 55 campuses surveyed included school plants that have not yet been subject to historic resource evaluations due to age (i.e., schools built primarily between 1955 and 1969) and schools that were previously identified as warranting re-evaluation once they reached 45 years of age. These included: (1) 10 high schools; (2) 22 schools identified in the 2002 "Phase 2" Getty survey as warranting re-evaluation; and (3) 23 elementary and junior high schools.

Historic Resources and CEQA

In addition to helping inform master planning efforts for LAUSD, this Historic Resources Survey and report are designed to facilitate compliance with CEQA, which requires lead agencies to consider the potential effects of proposed projects on historic resources as defined by CEQA. CEQA identifies a historic resource as a property that is listed in—or is eligible for listing in—the NRHP, CRHR, or local registers. NRHP-listed properties are automatically included in the CRHR. The criteria for both are similar and described below, with the NRHP letter (A, B, C, and D) followed by the corresponding CRHR number (1, 2, 3, and 4). In keeping with the 2001–2004 LAUSD Historic Resources Surveys, local criteria were not included.[3]

Resources that may be eligible for listing include buildings, sites, structures, objects, and historic districts. To qualify as a historic resource under CEQA, a resource must be significant at the local, state, or national level under one or more of the following criteria:

A/1: For an association with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States (NRHP Criterion A; CRHR Criterion 1);

B/2: For an association with the lives of persons important to local, California, or national history (NRHP Criterion B; CRHR Criterion 2);

C/3: As an embodiment of the distinctive characteristics of a type, period, region, or method of construction, representative of the work of a master or high artistic values (NRHP Criterion C; CRHR Criterion 3); or

D/4: Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation (NRHP Criterion D; CRHR Criterion 4).

There is no specific age threshold for CRHR eligibility; rather, the regulations specify that enough time must have passed for a property to be evaluated within its historic context.

Resources eligible for listing in the CRHR must retain enough of their historic character or appearance to be recognizable as historic resources and to convey the reasons for their significance. It is possible that resources that may not retain sufficient integrity for listing in the NRHP may still be eligible for the CRHR. The evaluation of integrity is based on how a property's physical features and attributes tell the story of its historic significance. The NRHP has defined the following seven aspects of historic integrity: Location, Design, Setting, Materials, Workmanship, Feeling, and Association.[4]

Previous Historic Resources Surveys and Studies

The consultants reviewed past LAUSD property surveys, including the following three historic resource surveys, as well as one in-progress project:

(1) **Historic resource surveys following the 1994 Northridge Earthquake**
Conducted for the Federal Emergency Management Agency (FEMA) and carried out in support of compliance under Section 106 of the National Historic Preservation Act, these surveys identified approximately 39 out of 71 campuses surveyed as historic (i.e., eligible for listing in the NRHP or for designation under a local ordinance);

(2) **"Phase 1" Getty survey**
This 2001–2002 historic resource survey was funded through a Planning Grant from Preserve LA, a program of the J. Paul Getty Trust. The survey included approximately 190 campuses, with results incorporating and expanding on the 1994 FEMA survey; a database of 410 schools aged 45 years or older was prepared as part of the project;

(3) **"Phase 2" Getty survey**
This 2002–2004 expansion of Phase 1 considered approximately 220 campuses;

(4) **SurveyLA**
A multi-year, citywide historic resource survey, partially funded by the J. Paul Getty Trust and covering all of Los Angeles; led by the City of Los Angeles Office of Historic Resources, the project is in its final phase as of spring 2014. Numerous LAUSD properties appear to be eligible for federal, state, or local listing and are therefore presumed historic resources for the purposes of CEQA. Final results from SurveyLA will be incorporated into the California State Historic Resources Inventory.

Included in the compiled LAUSD Historic Resources Inventory prepared for this report are eligibility findings from the 2001–2004 Phase 1 and Phase 2 Getty surveys (i.e., all campuses found eligible for either the NRHP and/or the CRHR). Eligibility findings for LAUSD schools made through SurveyLA, which is in progress as of June 2014, are available through the City of Los Angeles Office of Historic Resources.[5]

II. SURVEY METHODS AND PROCEDURES

The survey process used by Sapphos Environmental, Inc. staff was based on recognized professional standards, including those recommended by the National Park Service and the California Office of Historic Preservation guided by California Historic Resources Status Codes. Proceeding in stages, the survey method was as follows:

1. Pre-field research on each campus;
2. Fieldwork, including on-campus site inspections;
3. Compilation of results, with data entered into a property list including Assessor's Parcel Number; address; principal dates of construction; architect, designer, and/or contractor, if known; and past and present evaluation results;
4. Analysis, with compiled data and results of site inspections studied and compared with applicable criteria as well as the findings of the LAUSD Historic Context Statement;
5. Evaluation/Designation, wherein each campus was found either eligible or not eligible and assigned a California Historic Resources Status Code indicating evaluation findings.

Before beginning survey work, Sapphos Environmental, Inc. completed a comprehensive Historic Context Statement to guide evaluations. The complete LAUSD Historic Context Statement is included in this report as Appendix B. Framed in accordance with the NRHP Multiple Property Documentation (MPD) approach, the LAUSD Historic Context Statement identifies themes of significance, property types, eligibility standards, and integrity thresholds for LAUSD school properties from the late nineteenth century through 1969. By using the MPD approach, properties sharing a given theme of significance are assessed consistently, in comparison with resources that share similar physical characteristics and historical associations. In this way, the Historic Context Statement was designed to provide a consistent framework for evaluations both for the current scope of work and future LAUSD historic resource surveys.

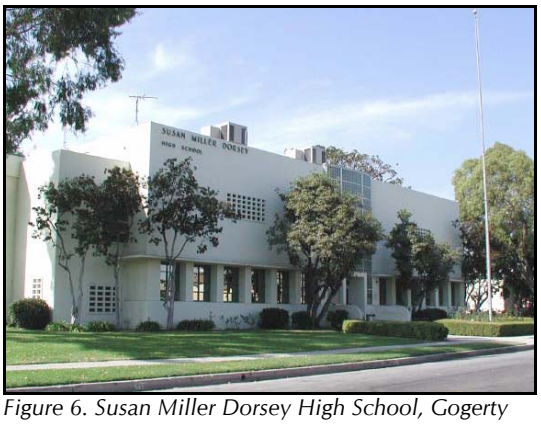

Figure 6. Susan Miller Dorsey High School, Gogerty and Noerenberg, Los Angeles (1937). Source: LAUSD.

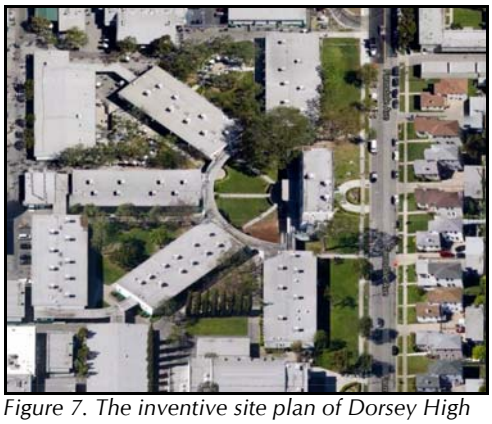

Figure 7. The inventive site plan of Dorsey High School. Source: Google Maps, 2013.

Survey results were incorporated into the LAUSD Historic Resource Inventory database; the inventory compiles 2013/2014 survey results with eligibility findings from the 2001–2004 Phase 1 and Phase 2 Getty surveys. The LAUSD Historic Resources Inventory prepared for this report is ArcGIS-compatible and designed for future use as an ArcGIS layer.

Campus-specific research incorporated a wide variety of sources, online databases and archives, as well as available print sources. Sapphos Environmental, Inc. staff investigated the origins and history of each school. This included research on architects, designers, or contractors involved in the school's design and construction; significant teachers, students, administrators, or other individuals who might have had an association with the school over time; and how the school reflected or fit within patterns of development, such as suburbanization, or significant events.

Staff members also reviewed and compiled data collected as part of LAUSD's Pre-Planning Surveys; relevant information was obtained from the Pre-Planning Surveys for all 55 campuses, including dates of construction, site maps, and plans.[6]

For site inspections, survey teams documented the principal buildings, structures, general character-defining features, and alterations. DPR Primary and Building, Structure, and Object forms were prepared for all campuses appearing to have either individual buildings or districts eligible for federal or state landmark designation. For potential historic districts, the identification of contributors and non-contributors was outside the scope of the current project, but is a suggested next step, as projects are proposed for school campuses including buildings, structures, related features, or historic districts appearing eligible for federal or state landmark designation and therefore qualifying as historic resources under CEQA.

Definitions of California Historic Resources Status Codes

The following are the California Historic Resources Status Codes assigned in the course of this survey and incorporated into the Historic Resources Inventory; codes also include eligibility findings from the 2001–2004 Phase 1 and Phase 2 Getty surveys:

1S/1D: Properties listed in the NRHP or CRHR either as individual resources (1S) or contributors to historic districts (1D).

2S/2D: Officially determined eligible for NRHP (and therefore also for the CRHR) as a single property or as a district contributor. As official evaluations, these codes were not modified during either the Phase 1 or Phase 2 studies.

3S: Appears individually eligible for the NRHP as a result of survey evaluation. These properties should also be understood as eligible for the CRHR.

3D: Appears eligible as a historic district for the NRHP as a result of survey evaluation. These properties should also be understood as eligible for the CRHR.

3CS: Appears individually eligible for the CRHR as a result of a survey evaluation.

3CD: Appears eligible for the CRHR as a potential historic district as a result of survey evaluation.

6Y: Officially determined ineligible for the NRHP.

6Z: Does not appear eligible for the NRHP or the CRHR, in the opinion of the surveyor.

Given that all codes from 1 to 5 denote properties eligible for either federal, state, or local listing, all codes from 1 to 5 correspond to properties considered to be historic resources for the purposes of CEQA.

III. SUMMARY OF THE LAUSD HISTORIC CONTEXT STATEMENT

The complete *Los Angeles Unified School District Historic Context Statement, 1870 to 1969*, follows this report as Appendix B. Prepared in accordance with the National Register Multiple Property Documentation approach, the study provided the survey team with a consistent, context-driven framework for evaluations of LAUSD campuses and buildings.[7]

To summarize, research conducted for the *Los Angeles Unified School District Historic Context* revealed four distinct periods and corresponding themes of significance:

(1) Founding Years, 1870s through 1909;
(2) Progressive Education Movement: Standardization and Expansion, 1910 to 1933;
(3) Era of Reform: Great Depression, Earthquake, and Early Experiments in the Modern, Functionalist School Plant, 1933 to 1944; and
(4) Educating the Baby Boom: Postwar Expansion and the Modern, Functionalist School Plant, 1945 to 1969.

Themes of significance associated with each era were developed, along with eligibility standards, character-defining features, and integrity thresholds. Additional sections describe the typical architectural styles of LAUSD schools, along with character-defining features for each, as well as a list of some of the leading architects and designers participating in the design of extant LAUSD schools and campuses. Given this survey's focus on unevaluated properties, constructed between the late 1940s and 1969, evaluations primarily drew upon the final era, from 1945 to 1969. The following section presents the applicable themes of significance, architectural style descriptions, and architects/designers corresponding to the era of 1945 to 1969.

Figure 9. Baldwin Hills Elementary School, Robert Alexander, architect, Los Angeles (1949–1951). Source: Getty Research Institute, Shulman Archives.

Figure 10. Early finger-plan school, Baldwin Hills Elementary School. Source: Google Maps, 2013.

CONTEXT: PUBLIC AND PRIVATE INSTITUTIONAL DEVELOPMENT | EDUCATION

THEME: LAUSD | EDUCATING THE BABY BOOM: THE POSTWAR MODERN FUNCTIONALIST SCHOOL PLANT, 1945–1969

By the 1950s, many of the design ideas considered experimental in the 1930s had matured and become the national standard for schools. Stylistically, schools might include some historicist detailing reflecting popular styles (such as Colonial Revival). However, overall, a unified campus design, building types and plans that accommodated a high degree of indoor-outdoor integration, ample outdoor spaces, and sheltered corridors marked the typology as the mature version of the functionalist school plant. The priority remained the creation of a domestic scale for schools. Campuses displayed a one-story massing for elementary schools, and up to two stories for middle and high schools. Site plans, which often featured a decentralized, pavilion–like layout, lacked the formality and monumentality that characterized earlier eras of school design.

School types expressive of these ideals include the finger-plan (1940s through 1950s) and cluster-plan (1950s), and variations on their basic themes. Combinations of these basic forms, which flexed according to available lot size and school enrollment, are also evident.

For LAUSD, the postwar years brought another round of reform as well as unprecedented expansion. Given the postwar classroom shortage, many campuses were constructed quickly, from standardized plans used district-wide, in designs that convey some of these ideas. The most intact and well-designed campuses among these, though, uniquely represent this era of reform and the midcentury modern school.

Property Type:	Institutional/Educational
Property Subtypes:	Elementary Schools, Junior High Schools, and High Schools
Period of Significance:	1945 to 1969
Area of Significance:	Education
Geographic Location:	Citywide; with concentrations in the San Fernando Valley and West Los Angeles
Area of Significance:	A/1

Eligibility Standards

- Clearly embodies the characteristics of a postwar modern functionalist school campus
- Displays a unified, functional site design, with buildings extending across the site and oriented in relation to outdoor spaces (courtyards, patios, outdoor play areas)
- One-story massing for elementary schools; up to two-stories for junior/high schools
- Classrooms, in detailing and plans, clearly express their function, with axial, finger-like wings, plentiful fenestration, and connections to the outdoors
- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features | Buildings/Structures

- Building plans and site design clearly express their function; classroom wings often exhibit one-story "finger-like" wings, arranged on an axis
- Easily identifiable indoor-outdoor spaces, connections to classrooms through the incorporation of patios, courtyards, and outdoor canopied corridors
- One-story massing, particularly for elementary schools; up to two to three stories for junior and high schools
- Building types and plans expressive of postwar ideals in school design; these can include (1) finger-plan schools (usually in 1940s through 1950s); (2) cluster-plan schools (beginning in 1950s); and (3) variations and combinations of these typologies clearly expressive of the ideals for informality, indoor-outdoor connections, and zoned planning for the site
- Varying elevations might display differentiated window sizes and configurations, in order to tailor interior light to sun patterns and create cross-lit classrooms

Character-Defining Features | Campus/District

- Unified campus design includes most or all of the following attributes: lack of formality and monumentality; low massing (usually one story for classrooms and up to two stories for auditoriums/multipurpose rooms); strong geometric ordering of buildings and outdoor spaces; decentralized, pavilion-like layout; rational, function-

driven site design; buildings extend across the site; buildings are oriented to outdoor spaces (courtyards, patios, outdoor areas), purposeful indoor-outdoor integration

- Automobile traffic/drop-off areas separated from campus; linked to interior via extended canopied corridors
- Buildings often turn inward, toward green spaces, courtyards, and lawns
- Outdoor corridors, sheltered beneath simple canopies, forming links between the buildings of the campus
- Classrooms often consist of a series of axial, modular units
- An informal, domestic scale for the buildings and campus might be especially evident in elementary schools
- Swaths of patios, terraces, and plantings adjacent to and alternating with buildings
- Generous expanses of windows, including steel- and wood-framed multi-light windows, in awning and hopper casements, clerestories, and fixed panes
- Flat roof or broken-plane roof often used for lighting and acoustical issues
- Modular design, with a rhythmic, asymmetrical but balanced composition
- Usually displays a modern design idiom, usually either regional modernist (with use of native materials such as stone, brick, and wood siding and/or framing), International Style modernist, or, by the early 1960s, Late Modern (more expressive and sculptural)
- Some examples might include some degree of historicist detailing or styles popular in the postwar period (such as American Colonial Revival); these are less common than modernist examples
- May have been designed by a prominent architect of the period
- Often associated with post–World War II suburbanization and growth near major employment centers beyond the city periphery (such as the San Fernando Valley and southwest Los Angeles)
- Often built in residential neighborhoods on large expanses of land, with large areas devoted to landscape design and playing fields (in particular for high school campuses)

Integrity Considerations

- Retains most of the essential physical features from the period of significance
- School expansion and new construction over the years, in particular in the postwar period, might have resulted in the addition of in-fill buildings and structures in areas that were originally designed open spaces. Such new additions should not interfere with or serve as a visual impairment to the designed connections between buildings, in particular classroom wings, and adjacent outdoor patios and spaces.

- Many postwar schools were designed to be easily expandable as enrollment increased; the original site design and building types and plans should be readily discernible. If additional wings were added or the campus extended, the additions should be compatible with and visually subordinate to the original.
- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable
- Should retain integrity of Setting, Materials, Design, Workmanship, Feeling, and Association from its period of significance
- Addition of portable or permanent buildings after the period of significance acceptable as long as original campus design is intact

Comments: This theme would most often apply to a campus evaluated as a historic district. Individual buildings and/or campuses exhibiting distinctive design features might also qualify under Criteria C/3, as the embodiment of the distinctive characteristics of a type/period or method of construction, as an example of the work of a master architect, or for high artistic values.

Figure 11. The "East LA Blow Out," Lincoln High School, 16 September 1968. Students protested for "better schools for Mexican Americans. Sal Castro was a teacher there and spearheaded the movement." Source: LAPL, Herald-Examiner Collection, 00041327.

CONTEXT: PUBLIC AND PRIVATE INSTITUTIONAL DEVELOPMENT | EDUCATION

THEME: LAUSD AND THE CIVIL RIGHTS MOVEMENT, 1954–1980

This theme of significance begins with the filing of the landmark U.S. Supreme Court case *Brown v. The Board of Education Topeka, Kansas*. Although *Brown v. Board of Education* addressed state laws that did not exist in California—namely, laws allowing for racially segregated public schools—this case and the Civil Rights Movement helped generate and focus attention on related issues in Los Angeles. Issues touched on racial division and cultural identity, equal access, and how to create more balance and diversity in public schools. Signaling the end of this period of significance is the U.S. Supreme Court decision effectively ending mandatory school busing as a solution to racial imbalance in California's public schools. Although this issue continued to form part of the social context for LAUSD, this period captures an era of intense debate and activism on the part of community members, parents, politicians and jurists, as well as teachers and administrators.

A school eligible under this theme might be the site of significant integration initiatives, challenges, or community activities related to the Civil Rights Movement and school integration. This might include initiatives for equal access to schools and/or to employment opportunities in LAUSD schools.

In addition, a school might qualify under this theme for a long-term association with a figure who was significant in the Civil Rights Movement and school integration.

Property Type:	Institutional/Educational
Property Subtypes:	Elementary Schools, Junior High Schools, and High Schools
Period of Significance:	1954 to 1980
Area of Significance:	Education/Ethnic Heritage
Geographic Location:	Citywide
Area of Significance:	A/1 and/or B/2

Eligibility Standards

- Was constructed during the theme of significance
- Was the site of significant integration initiatives, challenges, or activities related to the Civil Rights Movement and school integration
- Directly reflects the movement for equal access to schools, through integration activities, events, or protests, and/or equal access to employment opportunities in LAUSD schools
- Has a well-established, long-term association with a figure who was significant in the Civil Rights Movement and school integration (eligibility under B/2)

Character-Defining Features

- Retains most of the associative and character-defining features from the period of significance

Integrity Considerations

- Retains integrity of Location, Design, Setting, Feeling, Association
- Some materials may have been removed or altered
- If there are multiple buildings on campus constructed during the period of significance, these should be evaluated as a potential historic district

ARCHITECTURAL STYLES

MID-CENTURY MODERNISM / REGIONAL MODERNISM (POST-1945)

Mid-Century Modernism, or Regional Modernism, represents a middle ground between the formal, machine-age aesthetic of the International Style and a regional idiom reflecting local precedent and identity. In the postwar period through the 1960s, as practiced in Southern California, Mid-Century Modernism took its cues from the region's first-generation modernist architects such as Richard Neutra, Rudolph Schindler, Gregory Ain, Frank Lloyd Wright, and Harwell Hamilton Harris. In the postwar period, second-generation practitioners such as Raphael Soriano, Whitney Smith, and A. Quincy Jones, among many others, established Los Angeles as a center for innovative architectural design and culture.

Mid-Century Modernism is characterized by an honest expression of structure and function, with little applied ornament. Aesthetic effect is achieved through an asymmetrical but balanced, rhythmic design composition, often expressed in modular post-and-beam construction. Whether wood or steel, post-and-beam construction allowed for open floor plans, ease of expansion, and generous expanses of glazing to heighten indoor-outdoor integration. Infill panels of wood or glass are common, with glazing often extending to the gable. Buildings are generally one to two-stories, with an emphasis on simple, geometric forms. Capped with low-pitched gabled or flat roofs, a Mid-Century Modern building often displays wide eaves and cantilevered canopies, supported on spider-leg or post supports. Sheathing materials vary, with wood, stucco, brick and stone, or steel-framing and glass. Windows are generally flush-mounted, with metal frames.

Figures 14 and 15. Grover Cleveland High School, Administration Building (left) and typical classroom wing (right), Matcham & Granger and Associates (1959), Reseda. Source: Sapphos Environmental, Inc., 2013.

This style was seen in postwar institutional and commercial buildings, as well as residences, from 1945 until circa 1975.

Typical Character-Defining Features

- Horizontal design composition and massing; generally one to two stories; simple, geometric volumes; flat or shed roof, often with wide, cantilevered overhangs
- Exterior materials include stucco, brick, or concrete; modular design and planning
- Simply treated, natural materials and excellent craftsmanship
- Direct expression of structural systems, often in wood or steel post-and-beam
- Lack of historicizing ornament
- Generous expanses of fenestration, including bands of grouped multi-light windows
- Extensive use of sheltered exterior corridors, with flat or slightly sloped roofs supported by posts, piers, or pipe columns

Mid-Century Modernism | Expressionistic/Organic Subtype

- A more dynamic Mid-Century Modernism: combines sculptural forms with basic geometric volumes; curved, sweeping wall surfaces; dynamic, expressionistic roof forms, including butterfly, folded plate or barrel vault roof forms

ARCHITECTS AND BUILDERS OF LAUSD PROPERTIES

Since the early years of LAUSD, the school buildings and campuses of LAUSD have been designed by some of the region's most prominent master architects as well as the district's own architectural department. The following architects and firms were responsible for numerous designs of extant buildings throughout the district, since the early twentieth century:

- Thornton Abell
- Ain, Johnson & Day (Gregory Ain, Joseph Johnson, and Alfred Day)
- Robert Evans Alexander
- Allison & Allison (David Clark Allison and James Edward Allison)
- John C. Austin
- Austin and Ashley (John C. Austin and Frederic Ashley)
- Austin, Field & Fry (John C. Austin, Robert Field, Jr., Charles Eugene Fry)
- Edwin Bergstrom
- Daniel, Mann, Johnson & Mendenhall, DMJM (Phillip Daniel, Arthur Mann, Kenneth Johnson, Irvan Mendenhall)
- Stiles O. Clements
- Roland Coate
- Edelman and Zimmerman
- Sidney Eisenshtat
- Henry L. Gogerty
- Heitschmidt & Thompson (Earl Heitschmidt and Whiting Thompson)
- Frank Hudson
- Hudson & Munsell
- Stewart S. Granger
- Myron Hunt
- Hunt & Chambers
- Hunt & Burns
- Gordon B. Kaufmann
- George Lindsey
- Marsh, Smith, & Powell (Norman Marsh, David Smith, and Herbert James Powell)
- A. C. Martin
- Matcham & Granger (Charles O. Matcham Sr. and Stewart S. Granger)
- Alfred S. Nibecker
- Richard Neutra
- C.E. Noerenberg and Johnson
- Parkinson and Parkinson
- Charles Plummer
- Alfred Rosenheim
- Sumner Spaulding
- Spaulding & Rex (Sumner Spaulding and John Rex)
- William Stockwell
- Whiting Thompson
- Walker and Eisen
- Adrian Wilson & Associates

IV. SURVEY RESULTS

As a result of the LAUSD Historic Resources Survey, 2013/2014, the following 14 of 55 LAUSD campuses were found to include properties that appear eligible for either the NRHP and/or the CRHR. These campuses therefore include one or more buildings, structures, and/or related features that are presumed historic resources for purposes of CEQA:

1. 156th Street Elementary School — Eligible for CRHR (3CD)
2. Castle Heights Elementary School — Eligible for CRHR (3CD)
3. Chatsworth Senior High School — Eligible for NRHP (3D)
4. Cleveland Senior High School — Eligible for NRHP (3D)
5. Colfax Avenue Elementary School — Eligible for CRHR (3CD)
6. Dodson Middle School — Eligible for CRHR (3CD)
7. Fernangeles Elementary School — Eligible for CRHR (3CD)
8. Leapwood Avenue Elementary School — Eligible for NRHP (3D)
9. Narbonne Senior High School — Eligible for CRHR (3CD)
10. Pacoima Middle School — Eligible for CRHR (3CD)
11. Palisades Senior High School — Eligible for NRHP (3D)
12. Parmelee Avenue Elementary School — Eligible for CRHR (3CD)
13. Topanga Charter Elementary School — Eligible for NRHP (3D)
14. Webster Middle School — Eligible for CRHR (3CD)

Properties found eligible for the National Register under Criteria A/1, as representing the ideals and design principals of LAUSD from the era, were highly exceptional examples of the school type, though minor alterations might have been noted. Properties found eligible for the California Register only under the same criteria were generally outstanding examples of the applicable school type but exhibited a higher number of alterations.

The following sections present: (1) an overall district map, as well as detailed area maps, showing survey results, and (2) a pictorial overview of all eligible and non-eligible campuses, including school name, address, dates of construction, architect/designer (if known), and evaluation findings. Section 5 provides a tabulated version of the updated LAUSD Historic Resources Inventory.

Mapped Results: District Overview and Area Maps

Below is a composite map of the study area showing all LAUSD campuses, with eligibility indicated for campuses evaluated in the Historic Resources Survey, 2013/2014. The subsequent pages present enlarged versions of each subdivision of the composite map.

ELIGIBLE CAMPUSES: OVERVIEW

School Name: 156th Street Elementary School
Address: 2100 West 156th Street, Gardena
Date(s) of Construction: 1953
Architect/Designer: Unknown
Eligibility Criteria: CRHR 1
CHR Status Code: 3CD

Notes: Campus core appears eligible as a historic district under CRHR Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Excellent and intact example of the standardized finger-plan school used throughout LAUSD in the postwar period. Exemplifies LAUSD design principles of the era. CRHR eligible only (due to alterations).

School Name: Castle Heights Elementary School
Address: 9755 Cattaraugus Avenue, Los Angeles
Date(s) of Construction: 1951
Architect/Designer: Unknown
Eligibility Criteria: CRHR 1
CHR Status Code: 3CD

Notes: Campus core appears eligible as a historic district under CRHR Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Castle Heights Elementary School is an excellent example of a postwar indoor-outdoor LAUSD campus. Exemplifies LAUSD design principles of the postwar era.

School Name: Chatsworth Senior High School
Address: 10027 Lurline Avenue, Chatsworth
Date(s) of Construction: 1963
Architect/Designer: Unknown
Eligibility Criteria: NRHP 1, 3; CRHR A, C
CHR Status Code: 3D

Notes: The campus core appears eligible as a historic district under Criteria A/1, in the context of institutional architecture/educational facilities in Los Angeles. Excellent, intact example of postwar LAUSD school; exemplifies LAUSD design ideals and principles of the era. Also eligible as a historic district under Criteria C/3, as an excellent example of Mid-Century Modern design applied to institutional architecture. Some alterations, but intact and exceptional example that is eligible for the NRHP and CRHR.

School Name: Cleveland Senior High School
Address: 8140 Vanalden Avenue, Reseda
Date(s) of Construction: 1959–1960
Architect/Designer: Matcham and Granger & Associates
Eligibility Criteria: NRHP 1, 3; CRHR, A, C
CHR Status Code: 3D

Notes: The campus core appears eligible as a historic district under the NRHP and CRHR Criteria A/1, in the context of institutional architecture/educational facilities in Los Angeles. As an intact, indoor-outdoor finger- and cluster-plan school, Cleveland Senior High School exemplifies LAUSD design ideals and principles of the era. Also eligible as a historic district under Criteria 3, as an excellent example of Mid-Century Modern style applied to institutional architecture. Some alterations, but intact and exceptional example that is eligible for the NRHP and CRHR.

School Name: Colfax Avenue Elementary School
Address: 11724 Addison St., North Hollywood
Date(s) of Construction: 1950–1955
Architect/Designer: Unknown
Eligibility Criteria: CRHR 1
CHR Status Code: 3CD

Notes: Appears eligible as a historic district under CRHR Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Colfax Avenue Elementary School is an excellent, intact example of an indoor-outdoor, postwar finger-plan school. Exemplifies LAUSD design ideals and principles of the era. Some replaced/filled-in windows and non-original hardscaping; CRHR eligible as historic district.

School Name: Dodson Middle School
Address: 28014 South Montereina Drive, Rancho Palos Verdes
Date(s) of Construction: 1960
Architect/Designer: Unknown
Eligibility Criteria: CRHR 1
CHR Status Code: 3CD

Notes: Campus core appears eligible as a historic district under CRHR Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Excellent and intact example of an indoor-outdoor, postwar finger-plan school. Exemplifies LAUSD design principles of the era. CRHR eligible only (due to alterations).

School Name: Fernangeles Elementary School
Address: 12001 Art Street, Sun Valley
Date(s) of Construction: 1954
Architect/Designer: Unknown
Eligibility Criteria: CRHR 1
CHR Status Code: 3CD

Notes: Campus core appears eligible as a historic district under CRHR Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Administration building and assembly room form a distinctive entrance to the school and architectural anchor for adjacent neighborhood. From the interior, these buildings frame a courtyard and outdoor dining area. Site design includes expansive central lawn with mature (original) trees. Due to alterations, CRHR eligible only.

School Name: Leapwood Avenue Elementary School
Address: 19302 Leapwood Avenue, Carson
Date(s) of Construction: 1962
Architect/Designer: Unknown
Eligibility Criteria: NRHP A; CRHR 1
CHR Status Code: 3D

Notes: Campus core appears eligible as a historic district under CRHR Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Outstanding example of a one- and two-story school with a finger- and cluster-plan campus design.

School Name: Narbonne Senior High School
Address: 24300 South Western Avenue, Harbor City
Date(s) of Construction: 1955–1960
Architect/Designer: Daniel, Mann, Johnson & Mendenhall
Eligibility Criteria: CRHR 1
CHR Status Code: 3CD

Notes: Campus core appears eligible as a historic district under CRHR Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Excellent, innovative example of postwar LAUSD school; exemplifies LAUSD design ideals and principles of the era. Some replaced / filled-in windows and non-original seismic supports. CRHR eligible only (due to alterations).

School Name: Pacoima II Middle School
Address: 9919; 9921 Laurel Canyon Boulevard, Pacoima
Date(s) of Construction: 1953 - 1957
Architect/Designer: Unknown
Eligibility Criteria: CRHR 1
CHR Status Code: 3CD

Notes: Campus core appears eligible as a historic district under CRHR Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Excellent, intact example of postwar LAUSD school; exemplifies LAUSD design ideals and principles of the era. A number of alterations, including many filled-in / covered over clerestory windows, which has compromised the integrity of some classroom wings. CRHR eligible only (due to alterations). Site of a 1957 mid-air collision of two aircrafts.

School Name: Palisades Senior High School
Address: 15777 Bowdoin Street, Pacific Palisades
Date(s) of Construction: 1961
Architect/Designer: Adrian Wilson and Associates
Eligibility Criteria: NRHP 1, 3; CRHR, A, C
CHR Status Code: 3D

Notes: Campus core appears eligible as a historic district under Criteria A/1, in the context of institutional architecture/educational facilities in Los Angeles. Excellent, intact example of postwar LAUSD school; exemplifies LAUSD design ideals and principles of the era. Also eligible as a historic district under Criteria C/3, as an excellent example of Mid-Century Modern design (expressionist subtype) applied to institutional architecture in Los Angeles. Few visible alterations; eligible for NRHP and CRHR as historic district.

School Name: Parmelee Avenue Elementary School
Address: 1338 E. 76th Place, Los Angeles
Date(s) of Construction: 1962, 1964, 1965
Architect/Designer: Unknown
Eligibility Criteria: CRHR 1
CHR Status Code: 3CD

Notes: Campus core appears eligible as a historic district under CRHR Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Outstanding example of a one- and two-story school with a cluster-plan campus design and ample indoor-outdoor integration. CRHR eligible only (due to alterations).

School Name: Topanga Elementary School
Address: 22075 Topanga School Road, Topanga
Date(s) of Construction: 1953, 1955
Architect/Designer: Unknown
Eligibility Criteria: NRHP 1, 3; CRHR, A, C
CHR Status Code: 3D

Notes: Campus core appears eligible as a historic district under Criteria A/1, in the context of institutional architecture/educational facilities in Los Angeles. Excellent, intact example of postwar LAUSD school; exemplifies LAUSD design ideals and principles of the era. Also eligible as a historic district under Criteria C/3 as an excellent example of the Mid-Century Modern style applied to institutional architecture.

School Name: Webster Middle School
Address: 11330 Graham Place, Los Angeles
Date(s) of Construction: 1954–1958
Architect/Designer: Building Dept., Los Angeles Board of Education
Eligibility Criteria: CRHR 1
CHR Status Code: 3CD

Notes: Campus core appears eligible as a historic district under CRHR Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Outstanding example of a postwar, indoor-outdoor school employing an innovative site plan. CRHR eligible only (due to alterations).

INELIGIBLE CAMPUSES: OVERVIEW

School Name: 122nd Street Elementary School
Address: 405 East 122nd Street, Los Angeles
Date(s) of Construction: 1963
Architect/Designer: Unknown

Notes: Not eligible. In terms of the context of institutional architecture/educational facilities in Los Angeles, this campus is a typical but not outstanding example of a postwar LAUSD campus. Additionally, under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criterion 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: 153rd Street Elementary School
Address: 1605 W 153rd Street, Gardena
Date(s) of Construction: 1957–1958
Architect/Designer: Ain, Johnson & Day

Notes: Not eligible. This campus has many of the character-defining features of a postwar finger-plan school but not all the eligibility standards required under Criteria A/1 as an exemplification of LAUSD design ideals for postwar schools. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, this campus was designed by master architects Ain, Johnson & Day; however, the school plan and design overall do not stand out as an outstanding exemplar of the firm's work.

School Name: 186th Street Elementary School
Address: 1581 West 186th Street, Gardena
Date(s) of Construction: 1955–1962
Architect/Designer: John Kewell & Associates

Notes: Not eligible. Not typical of LAUSD design principles of the era; site design does not exhibit an exceptionally unified plan. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect. Displays some characteristics of Mid-Century Modern design, but the design does not rise to the level required for eligibility for either the NRHP or CRHR.

School Name: 232nd Place Elementary School
Address: 23240 Archibald Avenue, Carson
Date(s) of Construction: 1957–1968
Architect/Designer: A. Quincy Jones and Frederick E. Emmons & Associates; landscape architect Curtis Dixon Anderson

Notes: Not eligible. Campus and its classroom wings and buildings represent typical but not outstanding examples of a postwar finger-plan school. Lack of indoor-outdoor integration in campus plan; arcades are replaced with tunnel-like corridors. Represents the work of master architects A. Quincy Jones and Frederick E. Emmons & Associates, but is not an exceptional example of their many buildings throughout Southern California. The campus is not eligible under other applicable criteria.

School Name: Ambler Avenue Elementary School
Address: 319 East Sherman Drive, Carson
Date(s) of Construction: 1966
Architect/Designer: Unknown

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, the school does not qualify as an outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Amestoy Elementary School
Address: 1048 West 149th Street, Gardena
Date(s) of Construction: 1949–1957
Architect/Designer: Unknown

Notes: Not eligible. Not typical of LAUSD design principles of the era; site design does not exhibit an exceptionally unified plan. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Annalee Avenue Elementary School
Address: 19410 South Annalee Avenue, Los Angeles
Date(s) of Construction: 1966–1967
Architect/Designer: Unknown

Notes: Not eligible. The school campus and buildings represent a typical but not exemplary embodiment of LAUSD design principles of the era. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Avalon Gardens Elementary School
Address: 13940 South San Pedro Street, Los Angeles
Date(s) of Construction: 1948–1955
Architect/Designer: Unknown

Notes: Not eligible. This campus has many of the character-defining features of a postwar finger-plan school, but the range of construction dates, from 1948 to 1955, produced a campus plan that is not sufficiently unified to qualify under Criteria A/1 as an exemplification of LAUSD design ideals for postwar schools (under the context of institutional architecture/educational facilities in Los Angeles). In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Banneker Special Education Center
Address: 14024 South San Pedro Street, Los Angeles
Date(s) of Construction: 1972–1978
Architect/Designer: Unknown

Notes: Not eligible. In terms of the context of institutional architecture/educational facilities in Los Angeles, the campus is not representative of LAUSD design principles of the era. Additionally, under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Bonita Street Elementary School
Address: 21929 Bonita Street, Carson
Date(s) of Construction: 1958
Architect/Designer: Unknown

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Broadacres Elementary School
Address: 19424 South Broadacres Avenue, Carson
Date(s) of Construction: 1967
Architect/Designer: Unknown

Notes: Not eligible. In terms of the context of institutional architecture/educational facilities, the campus does not represent an outstanding example of LAUSD design principles of the era. Additionally, under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Brooklyn Avenue Elementary School
Address: 4620 Cesar Chavez Avenue, Los Angeles
Date(s) of Construction: 1960–1975
Architect/Designer: Unknown

Notes: Not eligible. In terms of the context of institutional architecture/educational facilities in Los Angeles, the campus is not representative of LAUSD design principles of the era. Additionally, under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Carnegie Middle School
Address: 21820 Bonita Street, Carson
Date(s) of Construction: 1965
Architect/Designer: Unknown

Notes: Not eligible. The campus overall is not typical of LAUSD design principles of the era. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Caroldale Learning Community
Address: 22424 Caroldale Avenue, Carson
Date(s) of Construction: 1960–1969
Architect/Designer: Unknown

Notes: Not eligible. The campus overall is not typical of LAUSD design principles of the era. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Carson Senior High School
Address: 22328 South Main Street, Carson
Date(s) of Construction: 1962–1969
Architect/Designer: Austin, Field, and Fry

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Century Park Elementary School
Address: 10935 South Spinning Avenue, Inglewood
Date(s) of Construction: 1948–1959
Architect/Designer: Unknown

Notes: Not eligible. Not typical of LAUSD design principles of the era; all of the original classrooms in addition to the auditorium are located in a single building; classrooms on double-loaded interior corridor. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Chandler Elementary School
Address: 14030 Weddington Street, Van Nuys
Date(s) of Construction: 1949–1956
Architect/Designer: Unknown

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Cimarron Elementary School
Address: 11559 Cimarron Avenue, Los Angeles
Date(s) of Construction: 1953–1957
Architect/Designer: Unknown

Notes: Not eligible. The school campus and buildings represent a typical but not exemplary embodiment of LAUSD design principles of the era. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Cowan Avenue Elementary School
Address: 7615 Cowan Avenue, Los Angeles
Date(s) of Construction: 1953–1958
Architect/Designer: Unknown

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Crenshaw Senior High School
Address: 5010 11th Avenue, Los Angeles
Date(s) of Construction: 1968
Architect/Designer: Unknown

Notes: Not eligible. Not typical of LAUSD design principles of the era. In terms of eligibility under Criteria A/1, research showed that construction of Crenshaw High School reflected post-Watts Riots investment in South Los Angeles schools. Research conducted within the parameters of the current scope, however, did not identify a broader, contextual pattern to justify eligibility under Criteria A/1 on this basis. In addition, research did not show that this campus was the site of a significant event. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Curtiss Middle School
Address: 1254 East Helmick Street, Carson, Los Angeles
Date(s) of Construction: 1969
Architect/Designer: Unknown

Notes: Not eligible. The school campus and buildings represent a typical but not exemplary embodiment of LAUSD design principles of the era. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or work of a master architect.

School Name: Dixie Canyon Avenue Elementary School
Address: 4220 Dixie Canyon Avenue, Sherman Oaks
Date(s) of Construction: 1949–1961
Architect/Designer: Unknown

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Encino Elementary School
Address: 16941 Addison Street, Encino, Los Angeles
Date(s) of Construction: 1949–1961
Architect/Designer: Unknown

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Francis Polytechnic Senior High School
Address: 12431 Roscoe Boulevard, Sun Valley
Date(s) of Construction: 1957
Architect/Designer: Austin, Field, and Fry

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Fullbright Avenue Elementary School
Address: 6940 Fullbright Avenue, Canoga Park
Date(s) of Construction: 1954
Architect/Designer: Unknown

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Grant Senior High School
Address: 13000 Oxnard Street, Valley Glen
Date(s) of Construction: 1958–1964
Architect/Designer: J. E. Stanton and William F. Stockwell

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design. Designed by prominent architectural firm, Stanton & Stockwell (J.E. Stanton & William F. Stockwell), but the school is not the most representative or intact example of the firm's work.

School Name: Haskell Avenue Elementary School
Address: 15850 Tulsa Street, Granada Hills
Date(s) of Construction: 1953–1965
Architect/Designer: Unknown

Notes: Not eligible. In terms of the context of institutional architecture/educational facilities in Los Angeles, this campus exhibits most of the character-defining features of the indoor-outdoor, finger-plan school constructed throughout LAUSD in the postwar period. However, due to alterations (primarily in-filled windows, altered window and door openings), the campus does not retain sufficient integrity to convey its period of significance.

School Name: Hawaiian Avenue Elementary School
Address: 540 Hawaiian Avenue, Wilmington
Date(s) of Construction: 1948–1966
Architect/Designer: Unknown

Notes: Not eligible. The campus overall is not typical of LAUSD design principles of the era. The 1948 Administration Building is noteworthy, but due to alterations (replaced windows), it does not retain integrity. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation.

In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Marianna Elementary School
Address: 4215 East Gleason Street, Los Angeles
Date(s) of Construction: 1958–1964
Architect/Designer: Unknown

Notes: Not eligible. In terms of the context of institutional architecture/educational facilities in Los Angeles, this campus is a typical but not outstanding example of a postwar LAUSD campus. Additionally, under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Monroe Senior High School
Address: 9229 North Haskell Avenue, North Hills
Date(s) of Construction: 1957
Architect/Designer: Heitschmidt and Thompson

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Park Avenue Elementary School
Address: 8020 Park Avenue, Cudahy
Date(s) of Construction: 1968
Architect/Designer: Unknown

Notes: Not eligible. In terms of the context of institutional architecture/educational facilities in Los Angeles, the campus is a common but not outstanding example of LAUSD design principles of the era. Additionally, under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Purche Elementary School
Address: 13210 Purche Avenue, Gardena
Date(s) of Construction: 1957
Architect/Designer: Unknown

Notes: Not eligible. The school campus and buildings represent a typical but not exemplary embodiment of LAUSD design principles of the era. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Sellery Special Education Center
Address: 15804 South Budlong Avenue, Gardena
Date(s) of Construction: 1961–1963
Architect/Designer: Unknown

Notes: This school was custom-built to serve a special needs population of children with severe handicaps. As such, the plan and building types vary from typical LAUSD plan typologies. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect. The school displays many character-defining features of the Mid-Century Modern architectural style. However, the school is not an outstanding or distinctive example of the Mid-Century Modern architectural style and does not qualify under Criteria C/3.

School Name: Sherman Oaks Elementary School
Address: 14755 Greenleaf Street, Sherman Oaks
Date(s) of Construction: 1948–1976
Architect/Designer: Unknown

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Stagg Street Elementary School
Address: 7839 Amestoy Avenue, Van Nuys
Date(s) of Construction: 1954–1958
Architect/Designer: Unknown

Notes: Not eligible. In terms of the context of institutional architecture/educational facilities in Los Angeles, this campus exhibits most of the character-defining features of the indoor-outdoor, finger-plan school constructed throughout LAUSD in the postwar period. However, due to alterations (primarily in-filled windows, altered window and door openings), the campus does not retain sufficient integrity to convey its period of significance.

School Name: Towne Avenue Elementary School
Address: 18924 Towne Avenue, Carson
Date(s) of Construction: 1958
Architect/Designer: Unknown

Notes: Not eligible. In terms of the context of institutional architecture/educational facilities in Los Angeles, this campus is a typical but not outstanding example of a postwar LAUSD campus. Additionally, under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Van Deene Elementary School
Address: 826 West Javelin Street, Torrance
Date(s) of Construction: 1960–1965
Architect/Designer: Unknown

Notes: Not eligible; very typical but not outstanding example of LAUSD design ideals of the era. Appears to be drawn from one of the standardized plans for schools during this period. Not the site of significant event or representative of a significant pattern of development. Not an outstanding example of architectural design or the work of a master architect.

School Name: Vintage Street Elementary School (Vintage Street Fundamental Magnet School)
Address: 15848 Stare Street, North Hills
Date(s) of Construction: 1953
Architect/Designer: Unknown

Notes: Not eligible. In terms of the context of institutional architecture/educational facilities in Los Angeles, this campus exhibits most of the character-defining features of the indoor-outdoor, finger-plan school constructed throughout LAUSD in the postwar period. However, due to alterations (primarily in-filled windows, altered window and door openings, and changes to the design configuration of the entrance and auditorium), the campus does not retain sufficient integrity to convey its period of significance.

School Name: White Middle School
Address: 22102 South Figueroa Street, Carson
Date(s) of Construction: 1956
Architect/Designer: Unknown

Notes: Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Wilmington II Middle School
Address: 1700 Gulf Avenue, Wilmington
Date(s) of Construction: 1951–1962
Architect/Designer: Unknown

Notes: Not eligible. The campus overall is not typical of LAUSD design principles of the era. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

School Name: Wilson Senior High School
Address: 4500 Multnomah Street, Los Angeles
Date(s) of Construction: 1970
Architect/Designer: Unknown

Notes: Not eligible. The campus overall is not typical of LAUSD design principles of the era. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.

V. UPDATED LAUSD HISTORIC RESOURCES INVENTORY

This section presents a tabulated version of the updated LAUSD Historic Resources Inventory. The inventory compiles results from the LAUSD Historic Resources Survey, 2013/2014, with eligibility findings from the 2001–2004 Phase 1 and Phase 2 Getty Historic Resources Surveys. The compiled results are presented in an Excel spreadsheet format and an Access Database format compatible with ArcGIS.

4063-012-900	13673	**156th Street Elementary School**	ES	2100	W	156th	St	Gardena	90249	1953		1953		6Z/7N	Campus core appears eligible as a historic district under California Register Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Excellent and intact example of the standardized indoor-outdoor, postwar finger-plan school used throughout LAUSD in the postwar period. Exemplifies LAUSD design principles of the era. California Register eligible only (due to alterations).	Yes	3CD
4308-019-900	13680	**Castle Heights Elementary School**	ES	9755		Cattaraugus	Ave	Los Angeles	90034	1951	1961	1951		6Z/7N	Campus core appears eligible as a historic district under California Register Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Castle Heights Elementary School is an excellent example of a postwar, indoor-outdoor LAUSD campus. Exemplifies LAUSD design principles of the postwar era.	Yes	3CD
2355-013-900	13681	**Colfax Avenue Elementary School**	ES	11724		Addison	St	North Hollywood	91607	1950	1955	1951		6Z/7N	Campus core appears eligible as a historic district under California Register Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Colfax Avenue Elementary School is an excellent, intact example of an indoor-outdoor, postwar finger-plan school. Exemplifies LAUSD design ideals and principles of the era. Some replaced/filled-in windows and non-original hardscaping; CRHR eligible as historic district.	Yes	3CD
2631-019-904	13594	**Fernangeles Elementary School**	ES	12001		Art	St	Sun Valley	91352	1948	1954	1946		6Z/7N	Campus core appears eligible as a historic district under California Register Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Administration building and assembly room form a distinctive, 1950s-flavored entrance to the school and anchor for the residential community around it. From the interior, these two buildings frame a courtyard and outdoor dining area. Site design features buildings and facilities oriented around an expansive lawn with mature (original) trees. Due to alterations on many of the classrooms, however, including clerestories that have been covered and sheathed in stucco, contributing buildings appear eligible for the California Register only.	Yes	3CD
2505-025-900	13707	**Olive Vista Middle School**	MS	14600		Tyler	St	Sylmar	91342	1958	1968	1958		6Z/7N	Campus core appears eligible as a historic district under Criteria C/3, as an excellent example of Mid-Century Modern design applied to institutional architecture. The elements of the campus that are considered contributors are the complex of buildings and structures at the entrance of the campus on Tyler Street, consisting of the Administration Building, the Library, the Health and Counseling Building, and the entrance portal that unifies the northwest side of the campus and forms a distinctive 1950s Mid-Century Modern entrance. Because the other structures on	Yes	3CD

6024-022-900	13815	**Parmelee Elementary School**	ES	1338	E	76th	Pl	Los Angeles	90001	1962	1965	1962		N/A	Campus core appears eligible as a historic district under California Register Criterion 1, in the context of institutional architecture/educational facilities in Los Angeles. Outstanding example of a one- and two-story school with a cluster-plan campus design and ample indoor-outdoor integration. California Register eligible only (due to alterations).	Yes	3CD
2741-002-900	13870	**Chatsworth Senior High School**	SH	10027		Lurline	Ave	Chatsworth	91311	1963		1963		N/A	Campus core appears eligible as a historic district under Criteria A/1, in the context of institutional architecture/educational facilities in Los Angeles. Excellent, intact example of postwar LAUSD school; exemplifies LAUSD design ideals and principles of the era. Inventive site plan, with classrooms radiating outward from a central landscaped quad. Also eligible as a historic district under Criteria C/3, as an excellent example of Mid-Century Modern design applied to institutional architecture. Some alterations, but intact and exceptional example that is eligible for both National Register and California Register.	Yes	3D
2104-004-905	13753	**Cleveland, Grover Senior High School**	SH	8140		Vanalden	Ave	Reseda	91335	1959	1960	1950		N/A	Campus core appears eligible as a historic district under National Register and California Register Criteria A/1, in the context of institutional architecture/educational facilities in Los Angeles. As an intact, indoor-outdoor finger-plan school, Cleveland Senior High School exemplifies LAUSD design ideals and principles of the era. Also eligible as a historic district under Criteria A/3, as an excellent example of Mid-Century Modern style applied to institutional architecture. Some replaced/filled-in windows and non-original hardscaping.	Yes	3D
7321-018-900	13817	**Leapwood Elementary School**	ES	19302		Leapwood	Ave	Carson	90746	1962		1963		N/A	Campus core appears eligible as a historic district under National Register and California Register Criteria A/1, in the context of institutional architecture/educational facilities in Los Angeles. Outstanding example of a one- and two-story school with a cluster-plan campus design and ample indoor-outdoor integration. Few visible alterations.	Yes	3D
4413-021-905	13742	**Palisades Charter Senior High School**	SH	15777		Bowdoin	St	Pacific Palisades	90272	1961		1958		N/A	Campus core appears eligible as a historic district under Criteria A/1, in the context of institutional architecture/educational facilities in Los Angeles. Excellent, intact example of postwar LAUSD school; exemplifies LAUSD design ideals and principles of the era. Also eligible as a historic district under Criteria C/3, as an excellent example of Mid-Century Modern design (expressionist subtype) applied to institutional architecture in Los Angeles. Few visible alterations; eligible for National Register and California Register as historic district.	Yes	3D
4445-	13816	**Topanga Charter**	ES	22075		Topanga	Rd	Topanga	90290	1953	1955	1940		N/A	Campus core appears eligible as a historic district	Yes	3D

005-902		**Elementary School**				School									under Criteria A/1, in the context of institutional architecture/educational facilities in Los Angeles. Excellent, intact example of postwar LAUSD school; exemplifies LAUSD design ideals and principles of the era. Also eligible as a historic district under Criteria C/3 as an excellent example of the Mid-Century Modern style applied to institutional architecture.		
6103-017-900	13812	**153rd Street Elementary School**	ES	1605	W	153rd	St	Gardena	90247	1957	1958	1956		6Z/7N	Not eligible. This campus has many of the character-defining features of a postwar finger-plan school but not all the eligibility standards required under Criteria A/1 as an exemplification of LAUSD design ideals for postwar schools. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, this campus was designed by master architects Ain, Johnson & Day; however, the school plan and design overall do not stand out as an outstanding exemplar of the firm's work.	No	6Z
6108-003-900	13303	**186th Street Elementary School**	ES	1581	W	186th	St	Gardena	90248	1955	1962	1907	McKinley Home 1907; 182nd St 1924; 184th St 1925	6Z/7N	Not eligible. Not typical of LAUSD design principles of the era; site design does not exhibit an exceptionally unified plan. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect. Displays some characteristics of Mid-Century Modern design, but the design does not rise to the level required for eligibility for either the National Register or California Register.	No	6Z
6114-030-902	13426	**Amestoy Elementary School**	ES	1048	W	149th	St	Gardena	90247	1949	1957	1915	Amestoy Avenue 1915	6Z/7N	Not eligible. Not typical of LAUSD design principles of the era; site design does not exhibit an exceptionally unified plan. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural	No	6Z

															design or the work of a master architect.		
6131-013-900	13618	**Avalon Gardens Elementary School**	ES	13940	S	San Pedro	St	Los Angeles	90061	1948	1955	1952		6Z/7N	Not eligible. This campus has many of the character-defining features of a postwar finger-plan school, but the range of construction dates, from 1948 to 1955, produced a campus plan that is not sufficiently unified to qualify under Criteria A/1 as an exemplification of LAUSD design ideals for postwar schools (under the context of institutional architecture/educational facilities in Los Angeles). In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.	No	6Z
4029-021-900	13675	**Century Park Elementary School**	ES	10935	S	Spinning	Ave	Inglewood	90303	1948	1959	1947		6Z/7N	Not eligible. Not typical of LAUSD design principles of the era; all of the original classrooms in addition to the auditorium are located in a single building; classrooms on double-loaded interior corridor. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.	No	6Z
2247-020-900	13619	**Chandler Elementary School**	ES	14030		Weddington	St	Van Nuys	91401	1949	1956	1949		6Z/7N	Not eligible. Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria 3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.	No	6Z

VI. CONCLUSION | RECOMMENDATIONS

The LAUSD Historic Resources Survey, 2013/2014, recommended a total of 14 of 55 campuses as eligible for either the NRHP and/or CRHR. Consequently, these campuses include buildings, structures, and features that are presumed historic resources under CEQA. The survey pool included a variety of LAUSD property types, including elementary, middle, and senior high schools, as well as special education centers. This variety was also reflected in the selection of campuses that appear to be eligible.

The following recommendations may further and expand the survey results in this report:

1. **Update and expand the *LAUSD Historic Resources Survey***
   LAUSD should update its comprehensive Historic Resources Survey in order to consider all as-yet unevaluated LAUSD assets. The survey could be initially broadened to include all post–1945 school buildings and campuses that have not yet been subject to context-driven evaluation. According to the *Los Angeles Unified School District History of Schools, 1855 to 1972*, there are roughly 175 campuses constructed between 1955 and 1969, as well as approximately 125 campuses constructed between 1945 and 1954.[8]

   The current survey examined 55 campuses, with approximately 245 remaining unevaluated.

   A comprehensive survey update would provide a cost-effective method for guiding district-wide redevelopment plans and CEQA compliance. It would also assist LAUSD in continuing stewardship of its many historically significant school buildings and campuses.

2. **Intensive-Level, District Recordation for Eligible Campuses**
   Proposed modernization or redevelopment projects may include the LAUSD campuses found eligible as historic districts in this survey or included in the LAUSD Historic Resources Inventory database. It is recommended that, prior to or concurrent with project planning, LAUSD commission an intensive-level survey by a qualified architectural historian to document all eligible and non-eligible buildings and structures (contributors and non-contributors) to the historic district. The qualified architectural historian should ideally meet and exceed the Secretary of the Interior's Professional Qualifications Standards for Architectural History and possess a minimum of 5 years of full-time experience conducting historic resource evaluations. It is further recommended that contributors and non-contributors be documented in ArcGIS maps for ease of use by LAUSD Facilities Services Division staff.

3. **Expand the *LAUSD Historic Context Statement* and *Historic Resources Survey* to include the period to 1980**
   Pursuant to Measure Q, district-wide modernization and redevelopment will unfold gradually, over many years. Broadening the LAUSD Historic Context Statement and survey to consider all schools constructed in the past 35 years (rather than 45 years) would allow the district to take proactive steps to identify historically significant campuses (and therefore historic resources under CEQA) prior to redevelopment planning and work. This would also bring the LAUSD comprehensive Historic Resources Survey up to date with the City of Los Angeles Office of Historic Resources citywide survey, SurveyLA.

4. **Conduct archival research to expand property eligibility under additional criteria**
   In the current scope, campus-specific work included research on events, patterns of development, and significant people associated with the schools included in the accompanying survey. However, scope limitations precluded extensive research on LAUSD's history that might result in eligibility under Criteria A/1 (such as LAUSD and the Civil Rights Movement) and Criteria B/2 (for an association with significant figures in the history of public schools in Los Angeles). These and other areas should receive further study. (The context of the Civil Rights Movement and Los Angeles schools was addressed, however, in the NRHP MPD form for African-Americans in Los Angeles.[9])

ENDNOTES

1 California State Government Code, Section 53094 permits 'the governing board of a school district, by vote of two-thirds of its members . . . [to] render a city or county zoning ordinance inapplicable to a proposed use of property by such school district . . .' The legislative history of section 53094 indicates that 'the Legislature deliberately accorded different treatment to school districts than to other local agencies because it was well aware that school construction was subject to almost complete control by the state. . . . The Legislature accordingly provided in section 53094 that school districts, as opposed to other local agencies, should retain the right to exempt themselves from local zoning ordinances.'" (*Santa Clara, supra*, 22 Cal.App.3d at p. 158 fn. 3.) Court of Appeal, State of California, Second Appellate District, Division 7, Los Angeles Unified School District, Petitioner and Appellant, versus City of Maywood, et al., Respondents and Defendants. Nos. B238629, B238630, Los Angeles Superior Court. Filed 13 February 2013.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Located in a residential neighborhood in the city of Gardena, the 156th Street Elementary School occupies a 4.9-acre site bounded by West 156th Street to the north, an alleyway to the south, an LAUSD facility to the east, and Van Ness Avenue to the west. Built in 1953 in a standardized school plan, the campus consists of a series of stucco-clad, one-story rectilinear buildings, with a central courtyard. The campus layout is characterized by finger-like classroom wings, arranged in a grid. Linking the classroom wings of the campus is a network of sheltered corridors, capped with flat roofs, with wood planks and cross beams and simple pipe supports. Campus buildings and structures display a similar massing, detailing, and Mid-Century Modern–influenced architectural style. *(See Continuation Sheet)*

BUILDING, STRUCTURE, AND OBJECT RECORD

***NHRP Status Code** 3CD

 ***Resource Name or #:** 156th Street Elementary School

B1. Historic Name: 156th Street Elementary School
B2. Common Name: Same
B3. Original Use: Institutional (Educational Facility)
B4. Present Use: Institutional (Educational Facility)
***B5. Architectural Style:** Mid-Century Modern–influenced
***B6. Construction History:** (Construction date, alterations, and date of alterations):

According to records on file with the Los Angeles Unified School District, the campus core was constructed in 1953. A $338,990 contract was awarded for the construction of a semi-permanent frame and stucco building to accommodate 520 students at the school, with the Hudson Construction Company serving as contractor ("Contract for Gardena School Let" 1953). All of the campus's permanent buildings, structures, and facilities date from 1953. The grounds also contain four portable/temporary buildings dating from 1997 located south of the campus core.

A number of alterations and repairs have taken place over the years, including seismic and systems upgrades, the removal of windows to accommodate the installation of air-conditioning units, the retrofitting of electrical systems, the removal and replacement of gutters and downspouts (*LAUSD Pre-Planning Survey, 156th Street Elementary School*, provides a list of repairs and improvements performed since the late 1990s). Alterations to the original buildings on campus include the replacement of some original windows and hardscaping.

***B7. Moved?** ■**No** ☐**Yes** ☐**Unknown** **Date:**_____ **Original Location:**_____

***B10. Significance: Theme**, Institutional (Educational Facility), "Educating the Baby Boom: Postwar Expansion and the Functional, Modern School Plant, 1945-1969" **Area** Los Angeles
Period of Significance: 1953 (District) **Property Type:** Institutional (Educational Facility)
Applicable Criteria: CRHR: 1
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The campus core of the 156th Street Elementary School appears eligible for the California Register of Historical Resources as a district under Criterion 1 as an excellent, intact example of a postwar finger-plan school in the Los Angeles Unified School District. The campus plan and buildings exemplify LAUSD design principles and ideals from the postwar period (as described in the *Los Angeles Unified School District Historic Context Statement, 1870 to 1969* [Sapphos Environmental, Inc. 2014]). While drawing on standardized plans used districtwide, the campus represents a relatively early example of LAUSD's postwar finger-plan school. Character-defining features include a unified site plan with mature landscaping, a network of arcades, Mid-Century Modern-influenced design, one-story massing, and incorporation of generous expanses of windows oriented to the outdoors. Due to alterations, such as the replacement of some windows, the campus is eligible for the California Register only.

***P3a. Description (continued):**

Buildings are capped with low-pitched shed roofs, terminating in thin, unadorned fascia and shallow eaves. Fenestration generally consists of multi-light, wood-frame windows in a variety of configurations. At the western elevations, classrooms display bands of awning clerestories. Eastern elevations display grouped, four-over-four, double-hung wood sashes. A network of sheltered arcades provides shade and circulation corridors between classroom wings and facilities. Windows occupy approximately 70 percent of the wall height on the eastern elevations and mark the location of the interior classrooms. Classroom entrances consist of wood doors topped with four-light transoms.

Located on the western portion of the campus, the assembly building/cafeteria is rectangular in plan and symmetrical in design composition. It consists of a two-story main block, capped with a flat roof and clad in stucco. The assembly building is accessed via a projecting one-story entrance wing, located on the north elevation. The entrance displays paired wood doors, flanked with thin, attached brick piers, and sheltered beneath a flat cantilevered roof. This roofline forms a continuous horizontal course across the façade and around side elevations. Projecting from the second story on the façade is a perpendicular stucco blade wall, which extends above the height of the building. The entrance is flanked by stack-laid brick piers and planters and two symmetrical bands of multi-light wood-framed windows. The brick motif is continued in the entrance steps and a wall extending from the Assembly Building to the campus entrance. Transoms over the entrance door and some of the windows on the main elevation appear to have been filled in. On the east elevation of the building is an open-air lunch pavilion.

The buildings and structures comprising the campus core are in good repair and enhanced with mature landscaping. Alterations include the removal of a number of windows on the east elevations of classroom buildings to accommodate air-conditioning units and the asphalt paving of open spaces between classroom buildings.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Located on a 5.1-acre site in west Los Angeles, Castle Heights Elementary School is bounded by Beverlywood Street on the north, Cattaraugus Avenue on the south, Castle Heights Avenue on the east, and Beverwil Drive on the west. The campus core was constructed in 1951 in a predominantly residential neighborhood. Displaying a Mid-Century Modern architectural style, the original campus consists of four principal buildings: a one-story administration building/classroom, a two-story auditorium/cafeteria, separate kindergarten, and a one-story classroom wing. Following the curve of Castle Heights Avenue on the east is a curved classroom building, constructed in 1961.

B1. Historic Name: Castle Heights Elementary School
B2. Common Name: Same
B3. Original Use: Institutional (Educational Facility)
B4. Present Use: Institutional (Educational Facility)
*B5. **Architectural Style:** Mid-Century Modern
*B6. **Construction History:** (Construction date, alterations, and date of alterations):

According to records on file with the Los Angeles Unified School District (LAUSD), the campus core was constructed in 1951, with an additional classroom building added in 1961. All of the campus's permanent buildings, structures, and facilities date from this period. Portable buildings were added between 1990 and 1998 to the north of the campus core.

A number of alterations and repairs have taken place over the years, including seismic and systems upgrades and the removal/replacement of original windows to accommodate installation of air-conditioning units (the *LAUSD Pre-Planning Survey, Castle Heights Elementary School* lists repairs and improvements carried out since the late 1990s). Alterations to the original buildings on campus include the removal and infilling of original clerestory and transom windows.

Period of Significance: 1951-1961 (District) **Property Type:** Institutional (Educational Facility)
Applicable Criteria: CRHR: 1
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The core of the campus of Castle Heights Elementary School appears eligible for the California Register of Historical Resources as a district under Criterion 1 as an excellent, intact example of an indoor-outdoor postwar school in the Los Angeles Unified School District. The campus plan and buildings exemplify LAUSD design principles and ideals from the postwar period (as described in the *Los Angeles Unified School District Historic Context Statement, 1870 to 1969*). The campus retains integrity of location, design, setting, workmanship, feeling, and association. However, due to alterations, the campus is not eligible for the National Register of Historic Places and is eligible for the California Register only.

Sketch Map, with north arrow required

(This space reserved for official comments.)

***P3a. Description (continued):**

The principal entrance is set back from the street and fronted by a lawn with mature trees and landscaping. Through the entrance breezeway, the campus opens to an expansive central courtyard containing a small lawn and a number of mature trees in brick planters. The courtyard is flanked by classrooms on the east and west, the cafeteria/auditorium on the south, and recreational areas on the north.

Rectangular in plan and sheathed in smooth stucco, the auditorium/cafeteria is two stories in height and capped with a flat roof and no eaves. The principal entrance is located on the south elevation; it consists of recessed double doors elevated on two concrete steps. The entrance's original side lights appear to have been filled in. Attached brick piers and a planter accent the primary elevation of the auditorium. Fenestration generally consists of multi-light wood-framed windows in a variety of configurations, including hopper casements and fixed panes. On the north elevation, a breezeway with an open skylight provides a transitional space between the auditorium, the cafeteria, and classrooms.

Classroom wings are one story in height and rectangular in plan, capped with flat roofs and no eaves. Exterior walls are clad in smooth stucco, with minimal adornment. Classrooms display groupings of six four-over-four, wood-framed double-hung sashes with simple wood surrounds. Doors are integrated into the window grouping and include fixed-pane transoms. Attached brick piers accent the exterior of the buildings, echoing the ornamental theme displayed at the entrance to the campus.

A later addition to the campus is the curved classroom along Castle Heights Avenue. The stucco-clad building forms a continuous, curved line along Castle Heights Avenue, where it is setback from the sidewalk and lined by a series of concrete planters. Stack-bond brick planters and wall cladding at the north and south ends of the building reiterate the decorative elements throughout the campus. One classroom deep, the building displays a curved recessed corridor with pole supports that open onto a landscaped courtyard. Two single-light, double-hung sashes grouped with a unadorned door and a small filled-in transom mark each classroom.

Buildings and structures comprising the campus core are in good repair. Alterations include the removal and infilling of some original windows, including on the auditorium and 1961 classroom, the replacement of windows with air-conditioning units, and placement of storage sheds in the main courtyard outside of classrooms. The campus otherwise retains sufficient integrity to convey its period of significance.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Located on a 37.5-acre site in northwestern San Fernando Valley, Chatsworth Senior High School is bounded by Lemarsh Street on the north, Lurline Avenue on the east, Vintage Street on the south, and De Soto Avenue on the west. The campus core displays the textbook features of the postwar indoor-outdoor school plant, with low (generally one story) classroom wings extending across a large site, and ample outdoor courtyards and landscaping, connected by an extensive system of arcades. Constructed in 1963 in a Mid-Century Modern architectural style, the focal point of the campus is an oval-shaped central lawn, with eight one-story classroom wings radiating outward from the lawn. The central lawn is bisected by a concrete walkway and accented with mature trees and landscaping. An outdoor auditorium, with concrete steps and stage, are located in the lawn's northwestern portion. Anchoring both sides of the lawn are the Administration Building in the southeast portion of the campus and the cafeteria, outdoor dining area, and multipurpose room in the northwest portion. Throughout the core of the campus, landscaped courtyards with walkways, benches, and landscaping line each classroom wing.

The Administration Building consists of a one-story building, rectangular in plan and capped with a low-pitched, front-gabled roof. The building is sheathed in stucco and brick. Windows display a variety of configurations, including fixed lights, transoms, multi-light double-hung sashes, and awning casements. *(See Continuation Sheet)*

B1. Historic Name: Chatsworth Senior High School
B2. Common Name: Same
B3. Original Use: Institutional (Educational Facility) B4. Present Use: Institutional (Educational Facility)
*B5. **Architectural Style:** Mid-Century Modern
*B6. **Construction History:** (Construction date, alterations, and date of alterations):

According to records on file with the Los Angeles Unified School District, construction was completed on Chatsworth Senior High School in 1963. A majority of the campus's extant buildings, structures, and facilities date from this period. The grounds also include several portable/temporary buildings from the 1940s and 1950s. After construction of the campus (especially during the 1980s and 2000s), additional modular, portable buildings and structures were added, primarily in the campus's southwestern portion. A number of alterations and repairs have taken place over the years, including seismic and systems upgrades, the installation of air-conditioner units, and safety improvements (see *LAUSD Pre-Planning Survey, Chatsworth Senior High School* for list of repairs and improvements carried out since the 1990s). Alterations to original buildings on campus include the infilling of original window openings with air-conditioners or other materials (such as wood paneling); such changes are visible on several classroom wings. The Multipurpose Room and Gymnasium also appear to have had window openings/doors altered or filled in.

*B7. **Moved?** ■No ☐Yes ☐Unknown **Date:**_____ **Original Location:**_____

Applicable Criteria: NRHP: A and C; CRHR: 1 and 3.
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The campus core of Chatsworth Senior High School appears eligible as a district under Criteria A/1 as an excellent, intact example of an indoor-outdoor postwar school in the Los Angeles Unified School District. The campus plan and buildings exemplify LAUSD design principles and ideals from the postwar period (as described in the Los Angeles Unified School District Historic Context Statement, 1870 to 1969). The construction of Chatsworth Senior High School in 1963 also reflects the continuing postwar suburban expansion of the San Fernando Valley. The campus is also eligible under Criteria C/3 as an excellent example of the Mid-Century Modern style applied to institutional architecture.

With plans launched in 1961, Chatsworth Senior High School was designed to accommodate overflow student populations from Canoga Park, Cleveland, and Granada Hills high schools. The school was originally designed to accommodate up to 2,500 students. Although the campus shows some signs of alteration, such as the removal of original hardscaping, windows, and doors, the campus core retains integrity of location, design, setting, workmanship, feeling, and association.

***Recorded by** Debi Howell-Ardila ***Date:** 2 January 2014 ☒ Continuation ☐ Update

***P3a. Description (continued):**

Swaths of wide horizontal louvers provide shade along the façade the Administration Building. The campus also displays a generous setback, with the Administration Building fronted by an expansive lawn and several mature trees.

The eight wings of the campus core, which include the main classroom wings and campus library, are largely identical in plan, configuration, and architectural detailing. Classrooms consist of rectangular, one-story buildings capped with low-pitched, front-gabled roofs. Roof lines terminate in thin gable bargeboards. At the ends of the roof gables, eaves extend and turn downward at a 90-degree angle, providing additional shading for the interior. These wings have double-loaded corridors with classrooms along each side. Generous bands of fixed and casement windows line the classroom wings; in a typical fenestration pattern for postwar LAUSD schools, windows occupy approximately 60 percent of the exterior wall height. Sheathing materials used on classroom wings vary; facing the central lawn, primary and secondary elevation walls are sheathed in smooth stucco, with some scoring detailing. The elevation facing the exterior of the campus displays patterned Roman brick sheathing and a cantilevered shelter over the entrance.

The entrances on both sides of the classroom wings feature similar architectural detailing. Flanking the entrances are thin, square piers, sheathed in off-white brick. Entrances consist of sets of metal doors with fixed and side lights, capped with clerestory windows. On all classroom wings, decorative tile work and horizontal vents accent the apexes of the roof gables. On the interior of the campus, the cantilevered roofs over entrances extend to form covered canopies. The concrete-clad canopies are capped with flat roofs and rest on thin, spider-leg supports.

Beyond the campus core, the school includes a music room, gymnasium, playing fields, and a shop building, as well as other ancillary buildings and structures. Alterations include the replacement of some original hardscaping and windows, and the infilling of original window openings with air-conditioner units. The core of the campus is otherwise intact. The original entrance of the gymnasium also appears to have been altered, with original windows and doors filled in on the eastern portion of the façade.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Located in northwest Reseda in the San Fernando Valley, Grover Cleveland Senior High School occupies a 33-acre site bounded by Roscoe Boulevard on the north, the Los Angeles River on the east, Wilbur Avenue on the southeast, Strathern Street on the south, and Vanalden Avenue on the west.

Constructed in 1959/1960 in the Mid-Century Modern style, the campus core displays the textbook features of the postwar indoor-outdoor school plant, with low (generally one story) classroom wings extending across a large site, and with outdoor courtyards and plantings, connected by an extensive network of arcades. The site plan combines the features of a finger-plan and a cluster-plan school, with axial, double-loaded classroom wings grouped around shared courtyard spaces and a large central lawn. The central lawn provides gathering spaces for students and doubles as an outdoor auditorium, with a raised concrete platform along the eastern portion of the lawn. A low wall, characterized by alternating panels of brick cladding and decorative grillwork, fronts the central lawn. The principal entrance to the school is located in the Administration Building, which is located along the northeastern portion of the lot. Classrooms extend outward from the main entrance, in a symmetrical plan linked by arcades. Courtyards and outdoor spaces throughout the campus exhibit mature trees and plantings, built-in concrete benches, planters and hardscaping. *(See Continuation Sheet)*

BUILDING, STRUCTURE, AND OBJECT RECORD

*NHRP Status Code 3D

 *Resource Name or #: Cleveland Senior High School

B1. Historic Name: Grover Cleveland Senior High School
B2. Common Name: Same
B3. Original Use: Institutional (Educational Facility) B4. Present Use: Institutional (Educational Facility)
*B5. **Architectural Style:** Mid-Century Modern
*B6. **Construction History:** (Construction date, alterations, and date of alterations):

Grover Cleveland Senior High School was constructed in 1959–1960 at an estimated cost of $5 million (*Los Angeles Times*, 22 September 1957). A majority of the campus's extant buildings, structures, and facilities date from this period. The grounds also include a number of portable/temporary buildings, most of which were added during the mid-1980s and early 2000s. A number of alterations and repairs have taken place over the years, including seismic and systems upgrades, the installation of air-conditioning units, and safety improvements (see *LAUSD Pre-Planning Survey, Cleveland Senior High School* for list of repairs and improvements carried out since the 1990s). Alterations to original buildings on campus include the infilling of some original window openings with air-conditioner units; such changes are visible on several of the classroom wings.

*B7. **Moved?** ■No ☐Yes ☐Unknown **Date:**_____ **Original Location:**_____
*B8. **Related Features:** Landscaping/mature trees, hardscaping, benches
B9a. Architect: Charles O. Matcham, Stewart S. Granger and Associates b. Builder: Unknown
*B10. **Significance:** **Theme**, Institutional (Educational Facility), "Educating the Baby Boom: Postwar Expansion and the Functional, Modern School Plant, 1945-1969" **Area** Los Angeles
Period of Significance: 1959-1960 (District) **Property Type:** Institutional (Educational Facility)
Applicable Criteria: NRHP: A and C; CRHR: 1 and 3.
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The campus core of Cleveland Senior High School appears eligible as a district under Criteria A/1 as an excellent, intact example of an indoor-outdoor postwar school in the Los Angeles Unified School District. The campus plan and buildings exemplify LAUSD design principles and ideals from the postwar period, specifically as an example of a finger-plan and cluster-plan school (as described in the *Los Angeles Unified School District Historic Context Statement, 1870 to 1969*). The construction of Cleveland Senior High School in 1959 also reflects the continuing postwar suburban expansion of the San Fernando Valley. The campus is also eligible under Criteria C/3 as an excellent example of the Mid-Century Modern style applied to institutional architecture.

With plans launched in 1957, Cleveland Senior High School was designed to accommodate 3,000 students in the rapidly expanding San Fernando Valley. Although the campus shows some signs of alteration, such as the removal of original hardscaping and windows, the campus core retains integrity of location, design, setting, workmanship, feeling, and association.

***P3a. Description (continued):**

The defining feature of the campus is the Administration Building, which is located along the northeastern portion of the lot. The one-story building is rectangular in plan and capped with a very low-pitched, front-gabled roof. Projecting from the north half of the building, a brick-clad wall separates the entrance from an adjacent parking lot. On the primary (east) elevation, wood-framed, full-height windows face the drop-off area for students and look out onto extensive landscaping, brick planters, and mature trees. Decorative detailing is primarily reserved for the entrance, which is centered beneath the gable and displays Roman-patterned brick and a flat-roofed cantilevered shelter. Horizontal vents mark the gable apex. A recessed courtyard with landscaping is located on the south elevation.

The main entrance is centered on the building and consists of paired metal doors, sheltered by a flat-roof arcade that provides a transition from the exterior to the interior of the school. A wall composed of alternating panels of brick and decorative grillwork separates the entrance arcade from an adjacent parking lot. As on the campus interior, the arcade is characterized by a stucco-clad shelter supported on steel, spider-leg supports (along the central lawn, the arcade is supported on thick, brick-clad piers). The structure is frankly expressed, with exposed steel supports exposed beneath the arcades. In a configuration that also characterizes classroom wings throughout the campus, the gable of the Administration Building displays shallow eaves trimmed with thin bargeboards. Along the side of the building, the roof line ends in medium cantilevered eaves sheathed in stucco. (This roof configuration and detailing are echoed in the classroom wings throughout campus.)

Typical classroom wings follow this pattern, with one-story rectangular buildings, capped with low-pitched front-gabled roofs. Along the length of the classrooms, windows are recessed and generally consist of two-over-two, double-hung wood sashes, grouped in rows that mark the location of the classrooms inside. These window groupings mark the classrooms on the interior and occupy approximately 60 percent of the exterior wall height. A variety of fenestration types and patterns are seen throughout campus, including a number of fixed pane, clerestories, and casements. Sheathing materials include stucco, with some decorative scoring, and patterned Roman brick. *(See Continuation Sheet, p. 4)*

***P3a. Description (continued):**

Beyond the campus core, the school includes a library (on the northwestern side of campus), cafeteria and sheltered outdoor dining area, gymnasium and recreational fields (in the southern portion of the lot), as well as a number of facilities and portable buildings/structures, installed primarily in the 1980s. All buildings on campus are one story with the exception of one classroom building, the cafeteria, and gymnasium. Overall, the campus core is in good repair and enhanced by extensive original (and new) landscaping. Visible alterations include some replaced hardscaping and concrete benches in the courtyards, the addition of security grills and air-conditioning units in some of the original window openings.

e. Other Locational Data: APN: # 2355-013-900

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Located on an 8-acre site in the Valley Village area of the San Fernando Valley, Colfax Avenue Elementary School is bounded by Colfax Avenue on the east, Huston Street on the south, Morella Avenue on the west, and Addison Street on the north. The campus exhibits the textbook features of a postwar, finger-plan school, with axial, one-story classroom wings, one room deep, extending across the site. Indoor-outdoor integration is created through the generous use of windows, which occupy approximately 80 percent of the wall height along eastern elevations, as well as through the incorporation of courtyards adjacent to classroom wings, outdoor gathering and recreational areas, and mature landscaping and trees.

The core of the campus consists of five rectilinear classroom wings, linked on both sides by continuous arcades. The arcades, which form circulation corridors throughout the main campus, display flat-roofed shelters, terminating in broad, unadorned wood fascia. Wood rafters and planks, visible from beneath the sheltered corridors, form the roof structure. Simple metal poles serve as supports for corridors throughout campus. Classroom wings display the differentiated fenestration patterns and roof eave treatment typical of postwar schools from this era (though ordinarily the orientation of the building would have been north-south, with fewer windows on the sunny, south side, and broad expanses of windows on the north side). In this case, the orientation of classroom wings is east-west, with fewer windows/clerestories on the west, and generous expanses of windows on the east. *(See Continuation Sheet)*

 *Resource Name or #: Colfax Avenue Elementary School

B1. Historic Name: Colfax Avenue Elementary School
B2. Common Name: Same
B3. Original Use: Institutional (Educational Facility) B4. Present Use: Institutional (Educational Facility)
*B5. **Architectural Style:** Mid-Century Modern–influenced
*B6. **Construction History:** (Construction date, alterations, and date of alterations):

According to records on file with the Los Angeles Unified School District, construction on the core of the campus was completed in 1950/1951. In 1955, a two-story auditorium was added in the northeastern corner of the parcel, at Colfax Avenue and Addison Street. The eastern portion of the campus grounds also includes several portable/temporary buildings from the late 1980s and early 1990s. A number of alterations and repairs have taken place over the years, including seismic and systems upgrades, the installation of air-conditioner units, replacement of original hardscaping, new fencing, and various safety improvements (see *LAUSD Pre-Planning Survey, Colfax Avenue Elementary School* for list of repairs and improvements carried out since the 1990s). In addition, alterations to original classroom wings include the infilling of some clerestory casements and entry glazing, as well as replacement of original windows with air-conditioner units; such changes are visible on several of the classroom wings.

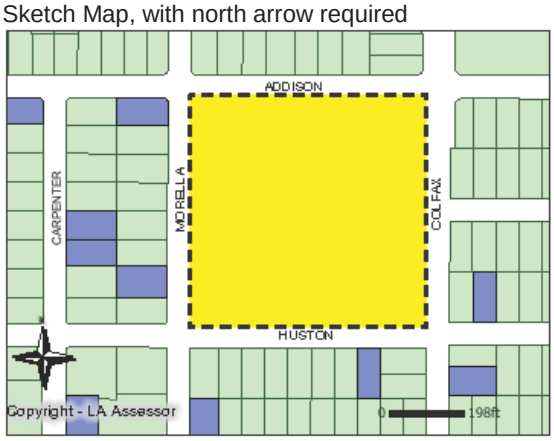
*B7. **Moved?** ■No ☐Yes ☐Unknown **Date:**_____ **Original Location:**_____
*B8. **Related Features:** Landscaping/mature trees, hardscaping, benches
B9a. Architect: Unknown b. Builder: Unknown
*B10. **Significance:** **Theme**, Institutional (Educational Facility),
"Educating the Baby Boom: Postwar Expansion and the Functional, Modern School Plant, 1945-1969" **Area** Los Angeles
Period of Significance: 1950-1955 (District) **Property Type:** Institutional (Educational Facility)
Applicable Criteria: CRHR: 1.
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The campus core of Colfax Avenue Elementary School appears eligible for the California Register of Historical Resources under Criterion 1 as an excellent, intact example of a modern, indoor-outdoor postwar elementary school in Los Angeles. The campus plan and buildings exemplify LAUSD design principles and ideals from the postwar period (as described in *the Los Angeles Unified School District Historic Context Statement, 1870 to 1969*). The construction of Colfax Avenue Elementary School in 1950/1951 also reflects the rapid postwar suburban expansion of the San Fernando Valley.

The campus exhibits some alterations, such as the removal of original hardscaping and windows and the infilling of original clerestory hopper casement windows, which spanned the length of classroom wings on the west elevations. While many of the casements appear to have been painted over or filled in with wood, the original size and configuration of the windows is still visible. Overall, the campus core (which includes the site plan, the relationship of buildings to outdoor spaces, and original plantings) retains integrity of location, design, setting, workmanship, feeling, and association. However, due to alterations, the campus is not eligible for the National Register and is eligible for the California Register only.

B11. Additional Resource Attributes: HP15. Educational Building. HP29. Landscape Architecture.

*B12. **References:** *(See Continuation Sheet)*



B13. Remarks: None

(This space reserved for official comments.)

Sketch Map, with north arrow required

Recorded by Debi Howell-Ardila **Date:** 23 January 2014 ☒ Continuation ☐ Update

***P3a. Description (continued):**

Along the west elevations, classroom windows are sheltered beneath wide cantilevered eaves, with wood beams and planks and broad, unadorned fascia boards. A slightly sloping shed roof caps the classroom buildings, with the slightly higher side located on the east. Clerestory windows appear to have originally spanned the west elevations of the classrooms (they are now filled in). On the east elevation, roof eaves are slightly shallower, also displaying wood beams and fascia boards. The main entrances to classrooms are located on the east elevation and generally consist of original metal doors with single-pane fixed windows. On the east elevations, classrooms are lined with generous expanses of wood-framed windows (which span roughly 80 percent of the wall height, from roof line nearly to the ground). Also on the east elevations of the classrooms are two square built-in mechanical service rooms, which appear to house air-conditioning units. These mechanical service rooms are flush with the roofline and accessed via paired metal doors.

The Administration Building, which serves as the main entrance to the campus, is located on the northeastern portion of the lot, on Addison Street. One story in height, the building is roughly rectangular in shape, with a street-level façade displaying recessed wings and features. The building is capped with a very low-pitched side-gable roof, terminating in shallow eaves with exposed wood beams. Broad, unadorned wood fascia boards terminate the roof line. A projecting, cantilevered shelter marks the entrance to the Administration Building. The entrance shelter has a flat roof with wide eaves and wood fascia boards, which display the school name. The roof line is trimmed with an open wood grid, marking a transitional space from the outside to the inside. The design composition of the façade is simple. The wall plane varies, with portions of the façade featuring wide expanses of wood-framed windows, set flush with the roof eaves, and recessed sheltered with sets of double-hung wood-framed windows, accented with brick planters along the ground. The façade includes a simple ornamental detail of a diamond-patterned metal screen and an angled wood grid serving as a roof support.

The campus exhibits many of the characteristics typical of Mid-Century Modernism. The Administration Building and classroom wings display a horizontal design composition, with very low-pitched or flat roofs and wide, cantilevered overhangs. There is an overall lack of applied ornament; campus buildings consist of simple, geometric volumes, with modular site planning. All classrooms are lined with windows, which appear to be wood-framed, multi-light double-hung sashes. *(See Continuation Sheet, p. 4)*

P5b. Photo (continued): (view and date)

Colfax Avenue Elementary School, Administration Building, view from inside campus. Southwest perspective. Source: Sapphos Environmental, Inc., 21 January 2014.

Recorded by Debi Howell-Ardila **Date:** 23 January 2014 ☒ Continuation ☐ Update

***P3a. Description (continued):**

Extending southward from the classroom wings and library are an outdoor dining area, capped with a flat roof supported on metal poles, a playground and recreational fields, and other facilities extending through the south portion of the campus. Mature trees appearing to date to the original construction era (early 1950s) are located throughout the campus, in particular in the northern portion. In the northeastern corner of the campus is the two-story auditorium building, constructed in 1955.

Alterations include the infilling of clerestory lights along the west elevations of classrooms, the apparent addition of mechanical sheds along the east elevations, the replacement of original hardscaping , as well as the addition of security gates at the entrance and bars on some of the windows. In addition, since the school's construction, a number of portable structures have been added, primarily in the southeastern portion of campus. The campus is otherwise in good repair, intact, and enhanced through landscaping and mature trees (including a number of old eucalyptus along Addison Street).

e. Other Locational Data: APN: # 7552-017-900

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Located in Rancho Palos Verdes, south of Los Angeles, Rudecinda Sepulveda Dodson Middle School occupies a 20.7-acre site in a residential neighborhood. The campus is generally bounded by Avenue Aprenda on the north, Avenida Estudiante on the south, Avenida Cuaderno on the east, and South Montereina Drive on the west and south. The school was constructed in 1960, with a number of small relocatable/temporary classroom buildings dating from 1935 through 2002, located on the periphery of campus along the west and north. The site plan displays the features of a postwar finger-plan school, designed in the Mid-Century Modern style. At the core of the campus, the focal point is an outdoor assembly area, courtyard, and lawn, which are framed by a two-story Multipurpose Building and one-story Administration Building. Extending from this student quad is a series of axial, finger-like classroom wings, linked by a sheltered arcade. Sheathed in smooth stucco, classrooms are one-story in height, one room deep, and capped with slightly sloped shed roofs with no overhanging eaves. Along the south elevation of classroom wings, a covered arcade, with a wide, wood plank-and-beam roof and simple pipe supports, provides a sheltered circulation corridor. *(See Continuation Sheet)*

BUILDING, STRUCTURE, AND OBJECT RECORD

***NHRP Status Code** 3CD

 ***Resource Name or #:** Dodson Middle School

B1. Historic Name: Rudecinda Sepulveda Dodson Middle School
B2. Common Name: Dodson Middle School
B3. Original Use: Institutional (Educational Facility) B4. Present Use: Institutional (Educational Facility)
***B5. Architectural Style:** Mid-Century Modern
***B6. Construction History:** (Construction date, alterations, and date of alterations):

According to records on file with the Los Angeles Unified School District, the core of the Dodson Middle School campus was constructed in 1960. Nine small portable/temporary buildings at the east and north sides of campus date from 1935 to 2002. A number of alterations and repairs have taken place over the years, including systems upgrades (the *LAUSD Pre-Planning Survey, Dodson Middle School* lists repairs and improvements performed at the school since the 1990s). Visible alterations include the removal of clerestory lights on some classroom wings and in-filling of windows with air conditioning units; expanses of locker storage added to the side elevations of some classroom wings also appear to be nonoriginal.

***B7. Moved?** ■**No** ☐**Yes** ☐**Unknown** **Date:**_____ **Original Location:**_____
***B8. Related Features:** Landscaping/mature trees, hardscaping
B9a. Architect: Unknown b. Builder: Unknown
***B10. Significance:** **Theme**, Institutional (Educational Facility),
"Educating the Baby Boom: Postwar Expansion and the Functional, Modern School Plant, 1945-1969" **Area** Los Angeles
Period of Significance: 1960 (District) **Property Type:** Institutional (Educational Facility)
Applicable Criteria: CRHR: 1.
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The campus core of Dodson Middle School appears eligible as a historic district for the California Register of Historical Resources under Criterion 1 as an excellent, intact example of a postwar finger-plan high school. The campus plan and buildings exemplify LAUSD design principles and ideals from the postwar period (as described in the *Los Angeles Unified School District Historic Context Statement, 1870 to 1969*).

The core of the campus is an outstanding example of a postwar, Mid-Century Modern school exhibiting a finger-plan campus design. Due to alterations, the campus is not eligible for listing on the National Register. Overall, the campus core retains historic integrity and continues to convey the reasons for its significance.

***P3a. Description (continued):**

Lined with mature trees and plantings, the campus entrance is accessed via an open courtyard paved with patterned red brick. To the east is a one-story, stucco-clad administration building and to the west a one-and-a-half-story library, also clad in stucco. Screening the windows on the library's east side is a prominent band of wide, vertical metal louvers set in a rectangular frame. The administration building is capped with a shed roof and no eaves, with the roof edge trimmed with metal. Connecting the two buildings is an entrance portal capped with a flat roof and shallow overhanging eaves. The portal consists of alternating panels of metal screen gates, trimmed with decorative geometric patterning, and rusticated, faux stone.

The brick pavers continue into an entrance courtyard, where a lawn and elevated concrete stage with semicircular steps form a central gathering area. Clad in stucco, the classroom wings are one-story in height and one room deep, capped with slightly sloped shed roofs. South elevations of the classrooms are lined with sheltered arcades consisting of wood plank and beam ceilings, supported on steel pipe supports. Along most north elevations, the roof terminates in no eaves. Sheltering each window grouping on the north elevations are flat, cantilevered eaves. Windows along the north elevations consist primarily of expansive two-light double-hung sash windows. Windows occupy approximately 60 percent to 70 percent of the wall height, providing natural light and views of courtyards with lawns, foundation plantings, and mature trees.

The buildings and structures comprising the campus core are in good repair, and enhanced with mature landscaping and trees. Alterations include the replacement of some original windows as well as apparent removal of original materials/openings along some classroom exteriors to accommodate the addition of nonoriginal lockers. The campus core is otherwise intact.

e. Other Locational Data: APN: # 2631-019-904

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Located on a 6.7-acre site in San Fernando Valley immediately north of the Interstate 5 freeway, Fernangeles Elementary School is bounded by Wicks Street on the northwest, Oneida Avenue on the southwest, a residential neighborhood on the northeast, and Art Street on the southeast. The campus core displays many typical features of a cluster- and finger-plan campus, with classrooms grouped around a central courtyard and axial classroom wings. The focal point of the campus from the exterior is the Administration Building and Assembly Building, which create a distinctive, Mid-Century Modern-style entrance to the school at the southwestern portion of the property. The two buildings form an interior courtyard, which is ringed by a grid-like trellis near the entrance and covered arcade, consisting of a wood-plank roof and wood cross beams, resting on simple pole supports. While the campus classrooms display extensive alterations (mostly in the form of the removal and in-filling of original clerestory windows), the two buildings at the campus entrance remain relatively intact and are highly representative of LAUSD's standardized postwar school, both in terms of style and building plan/features. *(See Continuation Sheet)*

B2. Common Name: Same
B3. Original Use: Institutional (Educational Facility) B4. Present Use: Institutional (Educational Facility)
***B5. Architectural Style:** Mid-Century Modern
***B6. Construction History:** (Construction date, alterations, and date of alterations):

According to records on file with the Los Angeles Unified School District, construction was completed on most of the extant campus of Fernangeles Elementary School in 1954. To accommodate expanding enrollment, over 20 portable buildings have been added to the campus since its construction, with a majority of these located in the northern and eastern portions of the property. As of 2014, portable buildings represent 67 percent of the classroom space on campus, with most added in the 1990s. A number of alterations and repairs have taken place over the years, including systems upgrades and the installation of air-conditioner units (see *LAUSD Pre-Planning Survey, Fernangeles Elementary School* for list of repairs and improvements carried out since the 1990s). The most visible alterations on the exterior include the removal of original windows and in-filling and covering of original window openings with stucco; this includes bands of original clerestory windows lining the west elevations of classroom wings. In other areas, original windows have been replaced with air-conditioning units. The Administration Building and Multipurpose Room also appear to have some in-filled windows.

"Educating the Baby Boom: Postwar Expansion and the Functional, Modern School Plant, 1945-1969" **Area** Los Angeles
Period of Significance: 1954 (District) **Property Type:** Institutional (Educational Facility)
Applicable Criteria: CRHR: 1.
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The grouping of the Fernangeles Elementary School Administration Building, Assembly Building, interior courtyard and landscaping features appears eligible for the California Register of Historical Resources as a district under Criterion 1 in the context of institutional architecture/educational facilities in the Los Angeles Unified School District. The Adminstration Building and Assembly Building form a distinctive, Mid-Century Modern–style entrance to the school and represent a recognizable anchor for the neighboring residential community. The finding of eligibility applies to the identified buildings and features, which, while exhibiting some alterations, continue to convey the reasons for their significance. Subsequent survey of contributing and noncontributing features will be necessary to make a detailed determination regarding all contributors and noncontributors to the historic district within the campus grounds.

Recorded by Debi Howell-Ardila and Marilyn Novell **Date:** 15 January 2014 ☒ Continuation ☐ Update

***P3a. Description (continued):**

The Assembly Building and Administration Building are connected by a brick wall and gate capped by a flat-roofed arcade. This gate serves as the entrance to campus; on the interior, it passes beneath a wood-grid trellis and opens onto a courtyard ringed with covered arcades. The approach to the main entrance also displays a series of tiered brick planters with landscaping. Matching stack-bond brick sheathes the south elevation of the Administration Building. Set at a right angle with the Assembly Building, the Administration Building is rectangular in plan, one story in height, and capped with a flat roof and tapered, shallow eaves. Fenestration consists of various configurations and types, and the building is clad in stucco. In a feature typical for Southern Californian Mid-Century Modern architecture, the roof line extends on the northern portion of the Administration Building in a wood-grid trellis, which encloses a tree.

The Assembly Building is roughly two stories in height, rectangular in plan, and clad in smooth stucco. The main portion of the building is capped with a flat roof with no overhanging eaves. Located on the southwest elevation, the main entrance to the Assembly Building consists of a pair of doors elevated on brick steps. The entrance is flanked by thin, stack-bond brick piers, which project from the wall, and two identical bands of recessed multilight windows.

Alterations include the apparent removal and filling-in of windows in variation locations. It also appears that windows have been covered at the upper level of the southwest elevation of the Assembly Building. The buildings are otherwise relatively intact and in fair repair overall.

e. Other Locational Data: APN: # 7321-018-900

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Leapwood Avenue Elementary School is located in a residential neighborhood in the city of Carson, south of Los Angeles. The campus occupies a 7.1-acre site bounded by Brenner Drive to the north, Eddington Drive to the east, East Elsmere Drive to the south, and Leapwood Avenue to the west. Constructed in 1962, the campus core consists of a series of two-story classrooms, assembly building, administration building, and two kindergarten buildings, all oriented around a central lawn and open-air lunch pavilion. A network of sheltered corridors and exterior stairways links the buildings throughout the campus core. Three temporary buildings are located at the eastern portion of the campus.

The campus entrance is set back from Leapwood Avenue by a lawn lined with landscaping and a row of mature trees. Defining the principal entrance are the assembly building to the south and the administration building to the north. Linking the two buildings is a sheltered entrance courtyard, capped with a low-pitched roof with a large, square skylight perforating the center. A concrete planter with landscaping is positioned beneath the skylight. The roof of the entry courtyard mirrors treatment of the arcades on the interior of the campus, with the low-pitched, side-gabled roofs and concrete-block piers. *(See Continuation Sheet)*

B1. Historic Name: Leapwood Avenue Elementary School
B2. Common Name: Same
B3. Original Use: Institutional (Educational Facility) B4. Present Use: Institutional (Educational Facility)
***B5. Architectural Style:** Mid-Century Modern–influenced
***B6. Construction History:** (Construction date, alterations, and date of alterations):

According to records on file with the Los Angeles Unified School District, construction of Leapwood Avenue Elementary School was completed in 1962. The total cost was just over $834,000, which was financed with school bond funds (*Los Angeles Times*, 1961). Three portable/temporary buildings were added at the eastern perimeter of campus in the 1990s. A number of alterations have taken place over the years, including systems upgrades, the removal of windows to accommodate the installation of air-conditioning units, replacement of gutters and downspouts, new fencing, and various other improvements, including the addition of an access ramp at the campus entrance (the *LAUSD Pre-Planning Survey, Leapwood Avenue Elementary School* lists repairs and improvements performed since the 1990s). In addition, security grilles have been added to windows throughout the campus, and storage units have been placed outside some of the classrooms.

Applicable Criteria: NRHP: A; CRHR: 1.
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The core of the campus of Leapwood Avenue Elementary School appears eligible for the National Register of Historic Places and California Register of Historical Resources under Criteria A/1 as an excellent, intact example of a postwar finger- and cluster-plan school campus in the Los Angeles Unified School District. The campus plan and buildings exemplify LAUSD design principles and ideals (as described in the Los Angeles Unified School District Historic Context Statement, 1870 to 1969). The campus combines one- and two-story massing with a finger- and cluster-plan site design. Overall, the campus core (which includes the site plan, the relationship of buildings to outdoor spaces, and original plantings) retains sufficient integrity to convey its period of significance.

(This space reserved for official comments.)

Sketch Map, with north arrow required

Recorded by Debi Howell-Ardila and Marilyn Novell **Date:** 10 March 2014 ☒ Continuation ☐ Update

***P3a. Description (continued):**

Most buildings on campus are clad in stucco and capped with low-pitched, gabled roofs with wide overhanging eaves. The two-story classroom building displays a folded-plate overhang, which shelters the corridor below. The floor of the upper corridor is supported on concrete-clad beams. A railing made of metal mesh panels, with decorative geometric detailing, encloses the second-story corridor and walkway. The corridors of the classroom building are free of vertical roof supports, exhibiting a clean, open look. Arcades capped with flat roofs, supported on steel-pipe supports, provide circulation corridors throughout the campus core.

Throughout campus, fenestration consists of a variety of treatments and configurations. Classrooms are lined with grouped, steel-frame windows, with clerestories lining the top and opaque panels along the bottom. At each side of the window bays are classroom entrances. (These are topped with panels that appear to have originally been transom lights.) Connected to the main classroom building via sheltered corridors is a freestanding restroom facility, adjacent to the campus's central courtyard. The facility is capped with a low-pitched, gabled roof with shallow overhanging eaves. Covered corridors line the facility along three sides. On the north elevation, fenestration consists of a band of multi-light, awning-style casements, with a thin rectangular light fixed pane below. A vent pierces the gable. Located south of central courtyard is a freestanding lunch pavilion. Octagonal in form, the roof is supported by a central concrete block pylon, with thin concrete block piers supporting each point of the roof eaves.

In terms of design, the campus exhibits characteristics typical of 1960's Mid-Century Modernism. Although the main classroom building is two stories, its broad overhanging eaves, ample fenestration, and flat roof give the building a strong horizontality. The campus buildings exhibit simple orthogonal massing with minimal ornament and a strong site plan that clusters a variety of building types around a unifying courtyard. With generous use of windows and exterior corridors and access to courtyards and mature landscaped areas, the campus exhibits a high degree of indoor-outdoor integration. The buildings and structures comprising the campus core are in good repair, with minimal alterations.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Located on a 37.5-acre site in a residential neighborhood in the Harbor City area, Narbonne Senior High School is bounded by 242nd Street on the north, 247th Street on the south, President Avenue on the east, and South Western Avenue on the west. The spiral-shaped site plan exhibits an innovative adaptation of the finger-plan school, with classroom wings radiating outward, in a spoke-like arrangement. At the center of spiral plan is a curved arcade, capped with a flat-roof with a coffered concrete ceiling and oversized steel-pole supports. This arcade system provides circulation corridors throughout the campus core. Located in the center of the circular arcade is a circular central open lawn, with a raised concrete stage and outdoor seating area. Classroom wings are generally rectangular in plan, one story in height, and primarily double-loaded, with two rows of classrooms on each side and a central hallway. The design of the classroom wings emphasizes the horizontal axis through the use of flat roofs ending in wide cantilevered roof eaves. Generous expanses of steel-frame, multi-light windows face onto landscaped courtyards between the buildings. *(See Continuation Sheet)*

***NHRP Status Code** 3CD

B1. Historic Name: Nathaniel A. Narbonne Senior High School
B2. Common Name: Same
B3. Original Use: Institutional (Educational Facility) B4. Present Use: Institutional (Educational Facility)
***B5. Architectural Style:** Mid-Century Modern-influenced
***B6. Construction History:** (Construction date, alterations, and date of alterations):

According to records on file with the Los Angeles Unified School District, the core of the Narbonne Senior High School campus was constructed in phases between 1955 and 1960. (Contemporaneous accounts in the *Los Angeles Times* also track the development history of the site; see "Unique School Design Planned for Lomita Site," *Los Angeles Times*, 1954; "Work Started on Large New School Portion," *Los Angeles Times*, 1955). In addition, numerous small portable/relocatable buildings dating from 1950 to 2002 are located throughout the campus. A number of alterations and repairs have taken place over the years, including systems and seismic upgrades (including the apparent incorporation of concrete support beams beneath cantilevered roof eaves on some of the classroom wings) and the removal of windows to accommodate the installation of air-conditioning units (see *LAUSD Pre-Planning Survey, Narbonne High School,* for a list of repairs and improvements performed since the 1990s). Other visible alterations include the filling-in of numerous transom windows over classroom entrances.

"Educating the Baby Boom: Postwar Expansion and the Functional, Modern School Plant, 1945-1969" **Area** Los Angeles
Period of Significance: 1955-1960 (District) **Property Type:** Institutional (Educational Facility)
Applicable Criteria: CRHR: 1.
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The campus core of Narbonne Senior High School appears eligible for the California Register of Historical Resources under Criterion 1 as an excellent, intact example of an innovative finger-plan school campus. The spiral campus plan represents a creative interpretation of LAUSD design principles and ideals from the postwar period (as described in the Los Angeles Unified School District Historic Context Statement, 1870 to 1969). Designed and engineered by architects Daniel, Mann, Johnson & Mendenhall, classroom wings and buildings extend outward in a spoke-like pattern from a central hub, a concept that the designers intended would reduce cross-campus travel distances and maximize available lot acreage. The plan was said to be a variation on the older finger plan, which included a long central corridor; in the spiral plan, the corridor is curved around a central open court ("Work Started on Large New School Portion," *Los Angeles Times*, 1955). Overall, the campus core retains sufficient integrity to convey the reasons for its significance. Due to alterations, the historic district does not appear eligible for listing on the National Register.

***P3a. Description (continued):**

Additional facilities on campus include an auditorium, a multi-purpose building, and two gymnasiums. All of the campus buildings are clad in smooth stucco. At the vehicle drop-off entrance to the campus, a semi-circular driveway is defined by low brick planters and is flush with a concrete walkway beneath a flat-roofed arcade.

c. Address 9919 Laurel Canyon Boulevard City Pacoima Zip 91331
e. Other Locational Data: APN: # 7552-017-900

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Located in San Fernando Valley in the community of Pacoima, the Pacoima Middle School occupies a 23.7-acre site bounded by Laurel Canyon Boulevard on the northeast, Kagel Canyon Street on the southeast, Cranford Avenue on the southwest, and Terra Bella Street on the northwest. Interstate 5 (Golden State Freeway) runs immediately adjacent to Cranford Avenue. The spoke-like site plan and general design and configuration of the classrooms display the typical features of LAUSD's standardized finger-plan school from the postwar era. Classroom buildings extend outward from the main entrance and courtyard, which include the Administration Building and Library at the eastern corner of the campus. Designed in a Mid-Century Modern-influenced style, classroom wings are one-story, single-loaded, stucco-clad rectangular buildings capped with slightly sloping shed rooms. Classroom entrances open off flat-roofed arcades, and a wall of windows defines each classroom on the opposite side. Covered arcades with steel pipe supports and flat roofs provide circulation throughout the campus. A central quad and the open areas between the classroom buildings are planted with lawns and mature trees. Typical of the postwar LAUSD high school campus, a two-story gymnasium is sited outside the campus core, near recreation areas. The auditorium and the cafeteria are also set apart from the classroom buildings on the edge of campus. Alterations include a number of removed and/or in-filled or stuccoed windows, including bands of clerestory lights. In fair repair, the campus core retains sufficient integrity to convey its period of significance.

***B10. Significance:** **Theme**, Institutional (Educational Facility),
"Educating the Baby Boom: Postwar Expansion and the Functional, Modern School Plant, 1945-1969" **Area** Los Angeles
Period of Significance: 1955 (District) **Property Type:** Institutional (Educational Facility)
Applicable Criteria: CRHR: 1.
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The campus core of Pacoima Middle School appears eligible as a historic district for the California Register of Historical Resources under Criterion 1 as an outstanding example of the standardized indoor-outdoor postwar school. Considered in the context of institutional architecture/educational facilities in Los Angeles, the campus plan and buildings exemplify LAUSD design principles and ideals from the period (as described in the *Los Angeles Unified School District Historic Context Statement, 1870 to 1969*). A number of alterations, including many filled-in or stuccoed clerestories, appear to have compromised the integrity of some classroom wings. Because of these alterations, the campus is not eligible for listing on the National Register. Overall, the campus core (which includes the site plan, the relationship of buildings to outdoor spaces, and original plantings) retains sufficient integrity to convey the reasons for its significance. Of historic note was Pacoima Middle School's role as the site of a 1957 plane crash in which seven students were killed and 74 other people injured when a transport plane collided with a jet over the school yard ("7 Killed, 74 Hurt in School Air Crash" 1957).

c. Address 14777 Bowdoin Street City Pacific Palisades Zip 90272
e. Other Locational Data: APN: # 4413-021-905

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Located on a 30.8-acre hillside site in Pacific Palisades, Palisades Charter Senior High School is bounded by Sunset Boulevard (north), Temescal Canyon Road (east), El Medio Avenue (west), and Bowdoin Street, which transects the campus. The two halves of campus are linked with pedestrian tunnels running beneath Bowdoin Street. Constructed in 1961 in an expressionist, Mid-Century Modern style, Palisades Charter Senior High School displays the textbook characteristics of a postwar indoor-outdoor high school campus. The heart of the campus consists of an expansive central lawn and gathering area, around which classrooms, an outdoor dining area, and other facilities are oriented. The central lawn includes mature trees, landscaping, benches, and an elevated stage. Classroom wings are generally two stories in height, rectangular in plan, and unified beneath a continuous folded-plate roof. Wall expanses are clad in patterned brick, with exposed stucco piers providing decorative accents. Broad, sheltered walkways fronted by simple metal grills and diagonal structural supports line upper stories of classrooms. Providing circulation corridors throughout campus is a network of sheltered arcades, which consist of steel I-beam roofs resting on simple, steel posts. To the east of the central lawn is an outdoor dining area, sheltered beneath a stylized zig-zag roof resting on simple pipe supports. South of Bowdoin Street, recreational facilities include a track, football stadium, and various recreational facilities and ancillary structures. *(See Continuation Sheet)*

B3. Original Use: Institutional (Educational Facility) B4. Present Use: Institutional (Educational Facility)
*B5. **Architectural Style:** Mid-Century Modern/Expressionistic
*B6. **Construction History:** (Construction date, alterations, and date of alterations):

According to records on file with the Los Angeles Unified School District, construction was completed on Palisades Charter Senior High School in 1961. A majority of the campus's extant buildings, structures, and facilities date from this period. The grounds also include several portable/temporary buildings, most of which were installed in the 1990s (and located primarily in the northern portion of campus and near the football stadium). A number of minor alterations have taken place over the years, including seismic and systems upgrades, safety and security improvements (see *LAUSD Pre-Planning Survey, Palisades Charter Senior High School* for list of repairs and improvements carried out since the 1990s). Alterations to original buildings on campus include the addition of X-shaped cross-bracing on outdoor walkways, the addition of security grills on some windows, and the in-filling/replacement of some original windows. The campus is otherwise highly intact and in good repair.

"Educating the Baby Boom: Postwar Expansion and the Functional, Modern School Plant, 1945-1969" **Area** Los Angeles
Period of Significance: 1961 (District) **Property Type:** Institutional (Educational Facility)
Applicable Criteria: NRHP: A and C; CRHR: 1 and 3.
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The campus core of Palisades Charter Senior High School appears eligible for the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR) as a district under Criteria A/1 as an excellent, intact example of a postwar indoor-outdoor educational facility in Los Angeles. The campus plan and buildings exemplify the design principles and ideals of the Los Angeles Unified School District from the postwar period (as described in the *Los Angeles Unified School District Historic Context Statement, 1870 to 1969*). The campus core also appears eligible for the NRHP and CRHR as a district under Criteria C/3 as an excellent example of the Mid-Century Modern style (Expressionist subtype) applied to institutional architecture.

***P3a. Description (continued):**

The principal entrance to campus is located on Bowdoin Street, with the main entry flanked by the Administration Building on the west and the Assembly Room/Cafeteria on the east. Arcades extend to the sidewalk and lead into the main campus. Architectural details on these signature buildings are reflected throughout the campus. Features include exterior walls clad in brick and stucco, sheltered beneath cantilevered overhanging eaves. Marking the centered entrance bays are a set of floor-to-ceiling stucco-clad piers. Formed by gaps in the brick cladding, these full-height piers provide visual interest on the exterior walls, which consist of broad expanses of brick sheathing. Continuous bands of metal sunshades line the southern elevation of the Administration Building. A variety of fenestration patterns are seen throughout campus, including steel-framed casements, fixed panes, clerestories, and transoms. Exterior walls of classrooms have built-in lockers. Throughout the core of the campus, landscaped courtyards with walkways, benches, and greenery provide outdoor spaces for gathering.

School facilities include a shop building, outdoor pool, parking areas, portable buildings and structures, added primarily in the 1990s, as well as other ancillary buildings and structures. Alterations include various safety and systems upgrades, the installation of security grills on some windows, and the in-filling of some windows. The core of the campus is otherwise highly intact and in good repair.

***B10. Significance (continued):**

With its "ultra-modern" design and $6-million cost, Palisades Senior High School was said to be the "most expensive and most architecturally distinctive plant in the Los Angeles city schools system" when it was built in 1961 ("Palisades High School Readied for Occupancy," *Los Angeles Times*, 1961). Due to its location—in a constricted valley, nestled in the hillsides of Pacific Palisades—the campus required $1-million of earth-moving activities to prepare the site. Los Angeles firm Adrian Wilson and Associates, responsible for design and engineering specifications, envisioned the school as a series of classroom wings focused on a central quadrangle, in a compact but open campus plan accommodating up to 3,000 students ("Record Earth-Moving Job at School Site Told" 1961). The campus core exhibits few signs of alteration and retains a high degree of integrity of location, design, setting, materials, workmanship, feeling, and association.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Parmelee Elementary School is located in a residential area of the Florence-Graham neighborhood in the City of Los Angeles. The campus occupies a 6.3-acre site bounded by East 76th Place to the north, East 77th Place to the south, Parmelee Avenue to the east, and Hooper Avenue to the west. The school consists of three two-story classroom buildings and three two-story utility buildings, in addition to a one-story administration building and two kindergarten buildings, all constructed in 1962. An Assembly Building and associated lunch pavilion were added in 1964, and nine temporary/portable buildings were added between 1960 and 2005 to the east and south of the campus core. All permanent buildings on the campus core are linked by sheltered corridors and wide overhanging eaves.

Parmlee Elementary School exhibits the typical features of a finger- and cluster-plan school. With generous use of windows and exterior corridors and access to courtyards and mature landscaped areas, the campus displays the indoor-outdoor connection typical of this school typology. The use of exposed cast-concrete structural elements and sculptural forms is associated with the style as it transitioned to the 1960s. *(See Continuation Sheet)*

B2. Common Name: Same
B3. Original Use: Institutional (Educational Facility) B4. Present Use: Institutional (Educational Facility)
*B5. **Architectural Style:** Mid-Century Modern
*B6. **Construction History:** (Construction date, alterations, and date of alterations):

According to records on file with the Los Angeles Unified School District, the core of the Parmelee Elementary School campus was completed in 1962, with the assembly building added in 1964 and the lunch pavilion in 1965. Construction of the school cost more than $1.2 million ("Pupils to Get Preview of New Parmelee School," *Los Angeles Times*, 1962). In 1965, an arson fire destroyed four classrooms ("School Hit by Two-Alarm Fire," *Los Angeles Times*, 1965). Three portable/temporary buildings were added at the eastern perimeter of the campus in the 1990s. A number of alterations and repairs have taken place over the years, including seismic and systems upgrades, the removal of windows to accommodate the installation of air-conditioning units, and various safety improvements (see *LAUSD Pre-Planning Survey, Parmelee Elementary School,* for a list of repairs and improvements performed since the 1990s). In addition, security grilles have been added to windows throughout the campus.

Applicable Criteria: CRHR: 1.
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The campus core of Parmelee Elementary School appears eligible for the California Register of Historical Resources under Criterion 1 as an excellent, intact example of a postwar finger- and cluster-plan elementary school. The campus plan and buildings exemplify LAUSD design principles and ideals from the postwar period (as described in the *Los Angeles Unified School District Historic Context Statement, 1870 to 1969*). The campus core also appears eligible under Criterion 3 as an outstanding, intact example of the Mid-Century Modern style applied to institutional architecture. Due to alterations, the campus is not eligible for listing on the National Register and is eligible for the California Register only. Overall, the campus core (which includes the site plan, the relationship of buildings to outdoor spaces, and original plantings) retains integrity of location, design, setting, workmanship, feeling, and association.

Sketch Map with north arrow required

(This space reserved for official comments.)

***P3a. Description (continued):**

The two-story auditorium and a small two-story classroom/utility building linking two of the classroom wings are clad in red brick over a convex barrel surface. The north and south elevations of the auditorium and the west elevation of the utility building display a curved façade that contrasts with rectilinear overhanging roofs and heavy cast-concrete beams. In plan, orthogonal one-story wings to the south and west of the curvilinear auditorium and a projecting one-story entrance at the east elevation present a complex arrangement of forms. At the main elevation, recessed entry doors are placed asymmetrically beneath a broad overhanging eaves supported by a brick pier.

The roof of the major east-west arcade is constructed of corrugated metal and suspended from the cross-beam of a single row of heavy cast-concrete pilons. Exposed vertical cast-concrete structural elements and exterior stairways contribute to a sturdy-appearing architecture throughout the campus. Inlaid blond brickwork on the north elevation of the auditorium and the west elevation of the administration building and a terra cotta screen on the curved façade of Building 6 contribute Mid-Century-Modern details to the campus. Cladding of the buildings throughout the campus varies between red brick and stucco, with structural concrete marking the locations of the classrooms and the corners of the classroom wings. Three two-story classroom buildings have back-to-back classrooms opening onto exterior corridors with views of courtyards. At the upper level, a metal handrail and mesh balustrade is supported by slender inward-curving metal stanchions. The floor of the upper-level corridor shelters the corridor below.

The lunch pavilion has a tripartite roof; the central section is in the form of a folded “butterfly” roof with the ends rising in a V shape above the two lower roofs at either side to allow circulation of air. The roofs are supported by steel poles. Otherwise, roofs throughout the campus are flat with wide fascia. Windows in the classroom wings are arranged in groups of four three-part fixed panes flanked by a plain metal door with a fixed transom on each side. The upper tier of windows and the transoms appear to be filled in on the administration building.

The campus design exhibits many of the characteristics typical of Mid-Century Modernism in the Expressionistic subtype as applied in the 1960s. Although the classroom buildings are two stories in height, their broad overhanging eaves and flat roof retain a simple, horizontal effect. The campus buildings have simple orthogonal massing with minimal ornament, and the site has a strong site plan that clusters a variety of building types around a unifying courtyard.

e. Other Locational Data: APN: # 4445-005-902

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Topanga Charter Elementary School is located in the Santa Monica Mountains on the western edge of Los Angeles County on a 12.2-acre site in heavily wooded, rugged terrain. The campus is on a cul-de-sac at the end of Topanga School Road, a semi-private road off Topanga Canyon Boulevard. The acreage downslope from the campus core is geologically unstable, and approximately half of the site remains undeveloped.

Despite its unique mountainous setting and dense vegetation, the campus displays many of the classic features of the postwar indoor-outdoor school, with low, single-loaded classroom wings connected by a system of arcades and exterior corridors. Immersed in this natural setting, the buildings are placed on various levels on terraced hillsides to accommodate the steep topography, with one classroom placed downslope from the Administration Building and the Assembly Building at a higher level shared with the main playground and temporary buildings. Each classroom has access to the outdoors and abundant air and natural light. Constructed in 1953 and 1955, the steel-reinforced red brick buildings display clean, simple lines with steep shed roofs and extensive windows typical of the Mid-Century Modern architectural style of the period. *(See Continuation Sheet)*

Applicable Criteria: NRHP: A and C; CRHR: 1 and 3.
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The campus core of Topanga Charter Elementary School appears eligible as a district under Criterion A/1 as an excellent, intact example of a modern, indoor-outdoor postwar school in the Los Angeles Unified School District. The campus plan and buildings exemplify LAUSD design principles and ideals from the postwar period (as described in the *Los Angeles Unified School District Historic Context Statement, 1870 to 1969*). The campus core also appears eligible under Criterion C/3 as an excellent example of the Mid-Century Modern style applied to institutional architecture.

The campus shows minimal signs of alteration, and the campus core retains integrity of location, design, setting, workmanship, feeling, and association.

***P3a. Description (continued):**

Topanga Charter Charter Elementary School (formerly called Topanga Charter Elementary School) was featured in a *Los Angeles Times* photo feature focusing on the open-air architecture of new L.A. schools. In 1961, the financially strapped Topanga Charter Elementary School District, consisting of a single school, voted for annexation to Los Angeles ("More and Better Schools Rising in Southland for New Generations" 1954; "Plans Studied to Add Junior College Districts" 1961; "Topanga Charter School to Be Joined to L.A. Group" 1961).

The two main classroom buildings and the Administration Building were constructed in 1953, with a classroom/sanitary building and an assembly building added in 1955. Steep shed roofs slope down from the back of the building, with a wide overhanging eave sheltering the corridor below. The ceilings of the corridors are composed of diagonal wood planks with doubled cross-beams. The cross-beams are bolted to an additional single beam at an angle of approximately 30 degrees that serves as support for a series of horizontal aluminum louvers that run the length of the corridor.

Built of reinforced masonry with no interior wall cladding, all of the campus buildings display the exposed red brick of the exterior inside the classrooms, further contributing to a melding of indoors and outdoors. On the southeast elevations of the two main classroom buildings and the south elevation of a third classroom building are banks of windows filling approximately 70 percent of the height of the wall. The arrangement of each bank of windows consists of alternately fixed and awning-style steel-framed windows set in vertical wood mullions. Grouped with the banks of windows defining each classroom is a single, unadorned wood door to one side with an outward-opening wood-veneer hopper transom. On the back of each classroom is a bank of seven clerestory windows, each composed of a band of awning-type windows with a fixed window below, providing the classrooms with cross-ventilation and additional natural light.

The shed roof of the Administration Building slopes from a low point at the back up toward the front, where it faces the central courtyard. The roof has a wide, flat wood fascia with no overhanging eaves. At the courtyard side of the building, a flat-roofed corridor supported by plain steel posts sits just above the northwest-facing windows. A series of unadorned wide doors with fixed transoms open onto the corridor, with banks of windows in various groupings. Each set of windows consists of a large awning-type window with a fixed light above and below.

A paved trail leads up a wooded pathway to the upper level of the campus, where the Assembly Building and Lunch Shelter, as well as four temporary buildings and the main playground, are located. The Assembly Building is a double-height block with a side-gabled roof and clerestory windows, and a lower one-story, side-gabled wing that houses offices and auxiliary rooms extends along the south and east elevations. A wide overhanging eave at the set-back entrance on the southeast corner of the lower section is supported by three red-brick piers.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries.)

Located on a 24-acre site in west Los Angeles, Daniel Webster Middle School is bounded on the north by Graham Place and, further north, Interstate 10, Sawtelle Boulevard and Interstate 405 (on the east), National Boulevard (on the south), and Butler Avenue (on the west). Constructed in 1954, the campus is located in a residential neighborhood of primarily single-family homes. The site plan is largely symmetrical, with a swath of landscaping, courtyards, and an open lawn forming an axis through the center. Classroom buildings, facilities, and circulation corridors form a ring around this central open space in the campus core. With a Mid-Century Modern–influenced style, the campus is generally low in scale and massing, with a decentralized, outdoor-oriented plan. The core of the campus consists of a series of finger-like classroom wings, radiating outward from a U-shaped, central lawn. An extensive network of sheltered arcades, made of wood plank roofs and beams, resting on simple steel pipe supports and railings, ring the central lawn and provide circulation corridors throughout campus. The central lawn and a landscaped courtyard at the entrance display an abundance of plantings and mature trees. At the southern portion of the central lawn is an elevated concrete stage. *(See Continuation Sheet)*

BUILDING, STRUCTURE, AND OBJECT RECORD

***NHRP Status Code** 3CD

 ***Resource Name or #:** Webster Middle School

B1. Historic Name: Richland Junior High School (original name)
B2. Common Name: Webster Middle School
B3. Original Use: Institutional (Educational Facility) B4. Present Use: Institutional (Educational Facility)
***B5. Architectural Style:** Mid-Century Modern-influenced
***B6. Construction History:** (Construction date, alterations, and date of alterations):

According to records on file with the Los Angeles Unified School District, construction was completed on Webster Middle School in 1954. A majority of the campus's extant buildings, structures, and facilities date from 1954. The grounds also include some portable buildings, with clusters located primarily in the southeastern and northwestern portions of campus. A number of alterations have taken place over the years, including seismic and systems upgrades, safety and security improvements (see *LAUSD Pre-Planning Survey, Webster Middle School* for list of repairs and improvements carried out since the 1990s). Alterations to original buildings on campus include the removal and infilling of original windows (in particular a number of clerestories on classroom wings). The campus is otherwise intact and in good repair.

***B10. Significance: Theme**, Institutional (Educational Facility),
"Educating the Baby Boom: Postwar Expansion and the Functional, Modern School Plant, 1945-1969" **Area** Los Angeles
Period of Significance: 1954 (District) **Property Type:** Institutional (Educational Facility)
Applicable Criteria: CRHR: 1.
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity)

The campus core of Webster Middle School appears eligible for the California Register of Historical Resources (CRHR) as a district under Criterion 1 as an excellent, intact example of a postwar indoor-outdoor educational facility in Los Angeles. The campus plan and buildings exemplify the design principles and ideals of the Los Angeles Unified School District from the postwar period (as described in the Los Angeles Unified School District Historic Context Statement, 1870 to 1969). Following a major bond initiative in 1952, plans for the school were announced with fanfare. With a sketch of the school's design, the *Los Angeles Times* thus described plans for the school: "One of the biggest school projects slated for Los Angeles in recent years is the starter of the $130,000,000 school building expansion program… It's the Richland Junior High School to be built on a 27-acre site at the west side of Sawtelle Bouelvard. The new school group of structures, designed to accommodate 1600 students, is estimated to cost $2,445,000" ("Big School Project Launches Program: Will Mark Start of $130,000,000 Expansion Plan," *Los Angeles Times*, 1952). The campus core exhibits some signs of alteration but retains a high degree of integrity of location, design, setting, workmanship, feeling, and association.

Recorded by Marilyn Novell **Date:** 4 February 2014 ☒ Continuation ☐ Update

***P3a. Description (continued):**

The signature buildings for the campus are located along the north, on Graham Place: these consist of the Auditorium (a two-story, brick and stucco-clad building in the northeast corner of campus), the Health and Counseling Building (a one-story, brick and stucco-clad building, set back from the street), an entrance gate, arcades, and landscaped courtyard, and a Library (one- and one-half stories, sheathed in brick and stucco). A low wall, consisting of alternating panels of brick and decorative metal framing and grillwork, separate the campus from the public right-of-way. This wall is flanked by two gates made of large brick-clad piers, capped with a flat roof and flared cornice (the entrance on the eastern side has been closed off with a security gate).

The Health and Counseling Building and Library have little applied ornament; the focal point of the design is the use of continuous bands of windows, mostly grouped rectangular lights, with both fixed and casement windows.

Classroom buildings are generally one-story high, one-room deep, and rectangular in plan. Most classrooms are capped with a low-pitched shed roof, with thin, unadorned eaves. Along the north elevations, classrooms have continuous bands of windows, which occupy approximately 70 percent of the wall height. The north elevation windows primarily consist of four-over-four wood-framed double-hung sashes. Along south elevations, indirect light is provided through the use of clerestory lights, some of which appear to be operable casement windows. Projecting from the south elevations of classrooms are wide, one-story arcades, with flat roofs, wood plank and beam structure, and simple steel pipe supports.

Throughout the core of the campus, landscaped courtyards with walkways, benches, and landscaping provide outdoor spaces for gathering. Beyond the campus core, school facilities also include a gymnasium and recreational fields, portable buildings and structures, added primarily in the 1990s, as well as other ancillary buildings and structures. Alterations include various safety and systems upgrades, the installation of security grills on some windows, and the infilling of numerous windows. The core of the campus is otherwise intact and in good repair.

I. INTRODUCTION

Behind every building type and feature comprising our built environment—whether commercial or residential buildings, urban plans, or parks—is a long history of practitioners who tried to harness the best ideas and technologies of their day to create quality environments for living and working. In California and throughout the United States, few other areas have generated as much debate and study, however, as environments for learning.

Whether in 1900 or 1960, reform-minded architects and designers, school boards, and educators used similar language to present their ideas for the most "modern" classroom and campus. Through this time, ideas evolved, of course. But the debate has always been shaped by the latest ideas about teaching methods and curricula, childhood development, and optimal environmental conditions for comfort, safety, and efficiency. Fueled by a national network of education-related organizations and publications, this has been a shared, ongoing project throughout the United States since the Progressive Era.

Spanning the early 1870s to 1969, this Historic Context Statement explores over a century of development of the Los Angeles Unified School District (LAUSD), examined in the context of school design in the United States. Since the Progressive Education Movement gained momentum in the early twentieth century, national standardization has been at the heart of school reform, in terms of both classroom curriculum and design. Therefore, the local story is best understood against the backdrop of the national context. This study explores the ways in which LAUSD's schools and campuses reflect a century of national practice, reform, and regional variation.

Project Summary and Scope

With nearly 800 campuses and a geographic span of over 700 square miles, LAUSD is the second largest public school system in the United States. The district's northern portion spans the San Fernando Valley, including Granada Hills, Chatsworth, Reseda, Woodland Hills, Van Nuys, Sylmar, San Fernando, Pacoima, and Sunland. Along the west, the district includes western Los Angeles, Pacific Palisades, Venice, and Westchester. Along the east, LAUSD borders Glendale, Monterey Park, Montebello, Commerce, Downey, and Long Beach. Within the district, extending south from Los Angeles, are the communities of Vernon, Huntington Park, Maywood, Bell, South Gate, Gardena, and Carson. LAUSD's southernmost portion includes San Pedro, Lomita, and Rancho Palos Verdes.

Since its founding in 1872, the district has commissioned, designed, and acquired a remarkable collection of buildings, campuses, and facilities. These properties reflect over a century of social, architectural, and technological advances, as well as ongoing educational and curricular reform. Extant properties range from the wood-framed schoolhouse of the late nineteenth century to superblock campuses displaying Mid-Century Modern architectural styles.

In July 2013, in anticipation of district-wide modernization efforts, LAUSD contracted Sapphos Environmental, Inc. to provide historic resource consulting services to inform master planning efforts and environmental review under the California Environmental Quality Act (CEQA). The scope of work includes updating the LAUSD Historic Context Statement, conducting historic resource surveys of 55 unevaluated campuses, and preparing design and procedural guidelines to help guide facilities management and planning efforts.

Purpose of Historic Context Statements

The *LAUSD Historic Context Statement* follows the National Register of Historic Places (NRHP) Multiple Property Documentation (MPD) format, which provides a consistent framework for evaluating properties sharing similar periods, geographic distribution, and historic themes.[1] The MPD approach defines themes of significance, eligibility standards, and related property types. Properties sharing a theme of significance are then assessed consistently, in comparison with resources that share similar physical characteristics and historical associations.

According to federal, state, and local law, landmark eligibility is not just tied to architectural style but also to significant people, events and patterns of development. Historic context statements facilitate the consistent consideration of these criteria. Three principal components go into context statements: historic themes, geographic areas, and chronological periods. Contexts offer more than a chronological history; they identify the patterns and events that drove development of an area—or, in this case, a building type, educational facilities—and caused the building type to acquire the form and appearance for which it became known.

Because of the high degree of national standardization of school curricula and facilities design, in particular during the postwar period, the *LAUSD Historic Context Statement* provides a framework for evaluating school plants not only in Los Angeles but also in other school districts throughout California and beyond.

Historic Resources and CEQA

The *LAUSD Historic Context Statement* is also designed to facilitate compliance with CEQA, which requires lead agencies to consider the impacts of proposed projects on historic resources. CEQA identifies a historic resource as a property that is listed on—or eligible for listing on—the NRHP, California Register of Historical Resources (CRHR), or local registers.

NRHP-listed properties are automatically included on the CRHR. The criteria for both are similar and described below, with the NRHP letter (A, B, C, and D) followed by the corresponding CRHR number (1, 2, 3, and 4). In keeping with the 2001–2004 Phase 1 and 2 LAUSD historic resources survey, this survey does not include local criteria.[2]

Resources that may be eligible for listing include buildings, sites, structures, objects, and historic districts. To qualify as a historic resource under CEQA, a resource must be significant at the local, state, or national level under one or more of the following criteria:

A/1: For an association with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States (NRHP Criterion A; CRHR Criterion 1);

B/2: For an association with the lives of persons important to local, California, or national history (NRHP Criterion B; CRHR Criterion 2);

C/3: As an embodiment of the distinctive characteristics of a type, period, region, or method of construction, representative of the work of a master or high artistic values (NRHP Criterion C; CRHR Criterion 3); or

D/4: Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation (NRHP Criterion D; CRHR Criterion 4).

Resources eligible for listing in the California Register must retain enough of their historic character or appearance to be "recognizable as historic resources and to convey the reasons for their significance."[3] Some resources that do not retain sufficient integrity for listing in the National Register may still be eligible for the California Register. There is no specific age threshold for California Register eligibility; rather, the regulations specify that enough time must have passed for a property to be evaluated within its historic context.

Focus and Parameters of the LAUSD Historic Context Statement

This Historic Context Statement creates a framework for evaluating Los Angeles's public schools at a critical juncture, as LAUSD begins planning for campus-wide modernization and redevelopment. Emphasized in this study, therefore, was the question of potential eligibility of schools under Criteria A/1, as outstanding examples of LAUSD design ideals and principles. The history and context of Los Angeles public school design and educational architecture are the particular focus of this study. Because the postwar era largely fell outside the scope of the 2002 LAUSD historic context statement, the postwar era is examined in detail.

This study represents not a comprehensive history but rather a first step in better understanding the evolution of school design in the district. Project limitations precluded extensive research on additional aspects of LAUSD's history that might result in eligibility

under Criteria A/1 and Criteria B/2. Campus-specific research was conducted on all pertinent topics for each of the schools surveyed. Subsequent research that establishes additional themes for the district overall would be an excellent area for future study. For example, this study offers a short section on LAUSD and the Civil Rights Movement; in addition, this topic was addressed in the National Register of Historic Places Multiple Property Documentation form for African-Americans in Los Angeles.[4] Given how broad and rich the topic is, however, ample opportunities remain for further research.

In terms of evaluations under Criteria C/3, this study also includes a section on the typical architectural styles of LAUSD schools. This material draws on and expands the 2002 LAUSD Historic Context Statement as well as the guidelines prepared by the City of Los Angeles Office of Historic Resources for historic resource survey work.

Inclusion in this context does not indicate eligibility for listing. Rather, the range of LAUSD campuses, past and present, illustrated or described here serves to define the context, themes of significance, and features of properties that might be found significant upon further study.

Project Team

Debi Howell-Ardila, senior architectural historian with Sapphos Environmental, Inc., served as project manager, principal investigator, and author of the LAUSD Historic Context Statement. Carole Zellie, historic resources manager, provided guidance and input. Marilyn Novell, historic resources coordinator, provided valuable research assistance, and Matthew Adams, senior technical editor, provided editorial expertise. Gwenn Godek of the LAUSD Office of Environmental Health and Safety served as project administrator and manager. The study also benefited from the feedback of LAUSD Facilities Services Divisions staff Mitra Nehorai; Janet Hansen, deputy manager of the City of Los Angeles Office of Historic Resources; and Linda Dishman, executive director, and Adrian Scott Fine, director of advocacy, of the Los Angeles Conservancy.

Report Preparation and Methodology

A wide range of repositories and archives were consulted in the course of this study. Among them were the combined collections of the University of Southern California (USC) libraries; the Los Angeles Public Library, including the Photo Collection, California Index, and Sanborn Fire Insurance Maps; the Getty Research Institute; and the historic *Los Angeles Times* and other digital newspaper collections. The photographic collections of the Getty Research Institute and the USC Digital Archive were also used. A variety of primary source materials were provided by LAUSD.

Research also explored an array of online and print sources. These included historic photographs and aerial images, reports, studies, and treatises on school architecture (ca. 1900 to 1950). Other sources included books, trade publication and newspaper articles, and architectural plans. Scholarly articles as well as specialized studies and chronologies of LAUSD were also consulted.

Also informing this study was a review of past LAUSD historic resource contexts and surveys, including the multiphase survey conducted by Leslie Heumann and Associates and Science Applications International Corporation between 2001 and 2004. In addition, Sapphos Environmental, Inc. reviewed the findings of historic resource surveys conducted through SurveyLA, a citywide, multiyear initiative of the City of Los Angeles Office of Historic Resources. To complement the work of SurveyLA, this Historic Context Statement reflects and draws upon the basic structure of context, themes, and property types used in SurveyLA for institutional architecture in Los Angeles. With a focus on the patterns and trends that shaped LAUSD's history and schools, as well as on-site access to district campuses, this context provides a supplemental framework to help inform and guide evaluations.

In accordance with LAUSD and the City of Los Angeles Office of Historic Resources, once complete, the LAUSD Historic Context Statement and Historic Resources Inventory database will be provided to the Office of Historic Resources. The Historic Resources Inventory being developed by Sapphos Environmental, Inc. is Arc-GIS compatible and can easily be utilized as an Arc-GIS layer in future historic resource surveys carried out for the City of Los Angeles.

Study Contents

This report consists of six sections: Section I, Introduction; Section II, Summary of Themes of Significance; Section III, Historic Context and Background; Section IV, Architectural Character; Section V, Themes of Significance; Section VI, Conclusion and Recommendations; and Section VII, Selected Bibliography. Four distinct eras for LAUSD were identified: Founding Years, 1870s to 1909; Progressive Education Movement: Standardization and Expansion, 1910 to 1933; Era of Reform: Great Depression, Earthquake, and Early Experiments in the Modern, Functional School Plant, 1933 to 1945; and Educating the Baby Boom: Postwar Expansion and the Functional, Modern School Plant, 1946 to 1969.

II. SUMMARY OF THEMES OF SIGNIFICANCE

Themes of significance were prepared for extant school property types. No known examples exist of some important types, notably the monumental, early-twentieth-century big-block school that was once a LAUSD standard. This school type was usually constructed of unreinforced, fire-resistant masonry. However, the material's earthquake vulnerability meant that most of these schools were either destroyed or damaged beyond repair in the 1933 Long Beach earthquake, or were subsequently replaced to comply with new building codes.

In order to facilitate cross-agency coordination, this section draws on relevant material developed by the City of Los Angeles Office of Historic Resources for historic resource evaluations. Information used in SurveyLA to evaluate institutional properties was consulted and adapted where appropriate.

CONTEXT: PUBLIC AND PRIVATE INSTITUTIONAL DEVELOPMENT | EDUCATION

THEME: LAUSD | FOUNDING YEARS, 1875–1894

This theme is embodied in Los Angeles's remaining one- and two-story wood-frame schoolhouses that generally display Late Victorian or vernacular styles. Only three nineteenth-century schoolhouses are known to remain from LAUSD's founding years. Schools constructed during this period display traditional modes of school design, before the Progressive Education Movement and widespread reform changed national construction standards and before increased urbanization necessitated larger-capacity school plants.

THEME: LAUSD | PRE–1933 LONG BEACH EARTHQUAKE SCHOOL PLANTS, 1910–1933

This theme reflects an important period for Los Angeles schools. First, it occurred after the Progressive Education Movement had triggered widespread reform of school design throughout the United States. This resulted in a more differentiated, expansive school plant, with specialized facilities and program-specific buildings and classrooms; this ended the era of the monumental, big-block school. Second, this period occurred before a statewide overhaul of school building codes and practices after the 1933 Long Beach earthquake.

This period also began as the 1920s ushered in a school building boom and period-revival golden age in Southern Californian architecture. The importance placed on public education was expressed through beautifully designed school buildings, often created by the region's leading architects. Campus design became more unified, with elaborate approaches and entrances. The advent of more grand entrances, as well as the incorporation of separate auditoriums, sited for ease of public access, reflected a growing sense that public education was a community affair.

Figure 9. 10th Street Elementary School, Los Angeles (1922). Source: LAUSD.

Replacing the big-block school, with internal corridors, was a generally lower-massed, spread-out campus. In some examples, designers replaced hallways with covered outdoor walkways. Building plans also evolved, as the traditional rectangular plan took on adjacent wings, in H-shaped, T-shaped, or U-shaped buildings that facilitated the creation of sheltered outdoor spaces and patios. Lower massing was particularly common for elementary schools.

Because most pre-1933 schools were substantially remodeled following the Long Beach earthquake, intact examples from this era are relatively rare. It is common to find 1920s-era schools that were remodeled following the earthquake; such schools might exhibit the building plans and configurations typical of the 1920s but with 1930s PWA Moderne and Streamline Moderne detailing.

Figures 10 and 11. Post–Long Beach Earthquake school: H-shaped plan and Mission Revival style of Reseda Elementary School (1936). Aerial photographs from 1959 (left) and circa 2010 (right). Source: U.S. Dept. of Agriculture, historicaerials.com (left) and LAUSD Reseda Elementary School Pre-Planning Survey (right).

THEME: LAUSD | POST–1933 LONG BEACH EARTHQUAKE SCHOOLS, 1933–1945

Following the 1933 Long Beach earthquake, state and city legislation regarding school building codes and practices shifted the character of LAUSD schools and campuses. Requirements of the Field Act (1934), such as maintaining one-story massing for elementary schools and no more than two stories for junior and high schools, mirrored reforms already under way. Classroom wings continued to be designed for connections to the outdoors, with L-, H-, U-, and T-shaped buildings accommodating sheltered courtyard and patio spaces. Continuing another trend under way in the 1920s, campuses displayed an increasingly unified site design, with sheltered corridors linking campus buildings.

The advances of the Progressive Education Movement also continued to shift school plant design. Campuses were increasingly differentiated, with administration buildings, auditoriums and gymnasiums, separate classroom, shop, and specialty wings, and cafeterias. Adequate indirect lighting and ventilation were provided through the use of generous bands of windows, including multilight sashes, casements, and clerestories. Stylistically, these buildings were less ornamental than their 1920s period-revival counterparts. An emphasis was placed on traditional Southern Californian styles, such as the Spanish Colonial and Mission Revival. Other styles included Streamline Moderne, Art Deco, and Late Moderne. Much post-earthquake reconstruction was funded through the Public Works Administration (PWA), and many schools exhibit a range of PWA Moderne styles.

THEME: LAUSD | EARLY EXPERIMENTS IN THE MODERN, FUNCTIONALIST SCHOOL, 1933–1945

Although this category shares general characteristics with the preceding theme (Post–1933 Long Beach Earthquake Schools), it is distinguished by an experimental approach to school design that emerged during the Great Depression. Such schools reflect the most avant-garde ideas of the era and the beginning of modern, functionalist school design. Stylistically, the proto-modernist school need not be purely "modern" in the sense of lacking any ornamental detailing. The significant changes reflected a philosophy that went a step further than did the schools of the 1920s in designing for function and integrating school buildings with exterior spaces. During the postwar construction boom, many of the same ideas that characterized these experimental schools became the norm throughout Los Angeles and the United States.

The notable differences between the two themes (or periods) relate to scale, site plan, and functional, child-centered design. The proto-modernist school has an explicitly domestic scale, with low ceilings and a lack of monumental design or massing. These schools generally exhibit a decentralized, nonhierarchical campus, with a strong geometric patterning applied to the site plan. Classroom wings generally consist of one-room-deep rectilinear buildings, lined with adjacent patios and landscaping. Building plans clearly express their function, with (usually) one-story massing, generous expanses of glazing, window sizes and configurations tailored to sun patterns and doors opening directly onto patio areas and courtyards. The preferred typology was the early version of the "finger-plan" school, with rectilinear classroom wings extending from a central axis.

Figure 17. Early finger-plan school, Baldwin Hills Elementary School. Source: Google Maps, 2013.

THEME: LAUSD | EDUCATING THE BABY BOOM: THE POSTWAR MODERN FUNCTIONALIST SCHOOL PLANT, 1945–1969

By the 1950s, many of the design ideas considered experimental in the 1930s had matured and become the national standard for schools. Stylistically, schools might include some historicist detailing reflecting popular styles (such as Colonial Revival). But, overall, a unified campus design, building types and plans that accommodated a high degree of indoor-outdoor integration, ample outdoor spaces, and sheltered corridors marked the typology as the mature version of the functionalist school plant. The priority remained the creation of a domestic scale for schools. Campuses displayed a one-story massing for elementary schools, and up to two stories for middle and high schools. Site plans, which often featured a decentralized, pavilion-like layout, lacked the formality and monumentality that characterized earlier eras of school design.

School types expressive of these ideals include the finger-plan (1940s–1950s) and cluster-plan (1950s), and variations on their basic themes. Combinations of these basic forms, which flexed according to available lot size and school enrollment, are also evident.

For LAUSD, the postwar years brought another round of reform as well as unprecedented expansion. Given the postwar classroom shortage, many campuses were constructed quickly, from standardized plans used district-wide, in designs that convey some of these ideas. The most intact and well-designed campuses among these, though, uniquely represent this era of reform and the midcentury modern school.

THEME: LAUSD AND THE CIVIL RIGHTS MOVEMENT, 1954–1980

This theme of significance begins with the filing of the landmark U.S. Supreme Court case *Brown v. The Board of Education, Topeka, Kansas*. Although *Brown v. Board of Education* addressed state laws that did not exist in California—namely, laws allowing for racially segregated public schools—this case and the Civil Rights Movement helped generate and focus attention on related issues in Los Angeles. Issues touched on racial division and cultural identity, equal access, and how to create more balance and diversity in public schools. Signaling the end of this period of significance is the U.S. Supreme Court decision effectively ending mandatory school busing as a solution to racial imbalance in California's public schools. Although this issue continued to form part of the social context for LAUSD, this period captures an era of intense debate and activism on the part of community members, parents, politicians and jurists, as well as teachers and administrators.

A school eligible under this theme might be the site of significant integration initiatives, challenges, or community activities related to the Civil Rights Movement and school integration. This might include initiatives for equal access to schools and/or to employment opportunities in LAUSD schools.

In addition, a school might qualify under this theme for a long-term association with a figure who was significant in the Civil Rights Movement and school integration.

III. HISTORIC CONTEXT AND BACKGROUND

This section provides a broad overview of the trends and patterns of development that shaped the facilities of the Los Angeles Unified School District since its founding in the 1870s. The following eras are covered:

A. Founding Years, 1870s through 1909

B. Progressive Education Movement: Standardization and Expansion, 1910 to 1933

C. Era of Reform: Great Depression, Earthquake, and Early Experiments in the Modern, Functionalist School Plant, 1933 to 1945

D. Educating the Baby Boom: Postwar Expansion and the Modern, Functionalist School Plant, 1945 through 1969

Each era is broken down into three sections: (1) National Context and Developments, exploring the trends in educational methods and curricula, as well as background information on school plant design; (2) Effects on School Buildings and Campuses, exploring how these trends resulted in changes to school plant facilities; and (3) Los Angeles City School Districts: Developments and Context, presenting Los Angeles–specific events that resulted in changes to educational policy and school plant design in Los Angeles and the region as a whole.

Sections also include a variety of historic and current photographs, with national and local examples illustrating the trends, patterns of development, and significant themes in the evolution of school plant design. Until 1961, what became the LAUSD comprised two separate entities: the Los Angeles City School District, covering primary education; and the Los Angeles City High School District. Throughout the Historic Context Statement, references to the district therefore reflect the administrative structure at the time (as the Los Angeles City school districts).

A. FOUNDING YEARS: 1870s THROUGH 1909[5]

Only three schools are known to remain from this early era in the history of the Los Angeles Unified School District: the Old Vernon Avenue School (1876; 450 N. Grand Avenue); the Old Farmdale School (1889; 2839 N. Eastern Avenue, in El Sereno); and, in present-day Santa Monica, the Old Canyon School (1894), now serving as the library for an elementary school. The Old Farmdale School, a Queen Anne Revival–style building attributed to architects Bradbeer and Ferris, was restored and rededicated as a museum in 1976.

Few resources remain, but the late-nineteenth- and early-twentieth-century context helps set the stage for the eras that followed. During the period considered in this context, school architects and educators shared a sense of urgency in describing the importance of the safe, well-designed school. Whether in 1906 or 1966, they used remarkably similar language to describe their era's contributions to designing the ideal "modern American school."

Describing the district's founding years helps illustrate the evolution of school plant design and the challenges faced by successive generations of architects and educators. Well into the postwar period, late-nineteenth-century educational philosophies and facilities remained a point of comparison, an example of what to avoid. In 1965, writing about modern Californian school design, State Department of Education official Charles D. Gibson declared that "big block schools with internal corridors and windowless classrooms are becoming a rarity, with most schools returning to the campus plan concept, using landscaped courts and natural materials to create informal environments."[6]

In fact, by 1965, the battle against the big-block school had long since been won. But the specter of the imposing, factory-like school plant remained the example against which new ideas were measured.

NATIONAL CONTEXT | DEVELOPMENTS

In the early years of American school design, the most typical building type for educational facilities had been the wood-framed, one-room schoolhouse—a basic typology that attempted "to be all things for all children," as well as all things for all teachers and educational methods.[7] Rapid urbanization throughout the United States called for a new approach. Large-scale schools, with classrooms accommodating several dozen pupils, were needed. With the increased demand, public schools started separating children into grades, with separate classrooms for each rather than a single large room housing all grades.

The new building typology tended to be rectangular in plan, with multistory massing, sanitation systems and facilities placed in a basement, and classrooms designed for large groups of students seated in rows. High ceilings accommodated tall windows, which provided the main source of interior illumination. In his study of the history of the American school, R. Thomas Hille observed that "a typical urban school from this era was organized in a single block of one or two floors, with standardized classrooms on each floor organized symmetrically around a central hallway. ... School furniture was already standardized and typically included individual desks organized in rows and bolted to the floor."[8]

This typology fit the curricula and methods of the time. Before the Progressive Education Movement gained momentum throughout the United States, beginning in the 1880s, primary and secondary schools continued to follow traditional methods emphasizing rote memorization and discipline, in an atmosphere that was regimented and authoritarian (rather than flexible and participatory).

In this respect, Los Angeles's early schools were similar to schools around the country. Los Angeles educators and administrators followed the philosophy of Johann Heinrich Pestalozzi (1746–1827), an influential Swiss pedagogue and reformer, and his "emphasis on the disciplinary values of the subjects taught."[9]

Pestalozzi's thinking mirrored the trends of American education at the time, with an emphasis on memorization and recitation. In Los Angeles schools, "All pupils did the same lessons in the same way. There was no recognition of individual differences."[10] Early school officials emphasized the "disciplinary values of their subjects" and uniform teaching methods for all students and classes.[11]

At this time, the effects of the Progressive Era—the period of social activism and political reform associated with the 1890s through the 1920s—were becoming evident in the public schools. In Los Angeles, when promoting the activities and accomplishments of the schools, district officials began describing a general liberalization of teaching methods and curriculum. The new programs were based less on discipline—including, as one official proudly pointed out, a diminishing reliance on corporal punishment—and were more participatory and tailored to children's nature and needs.

In this way, as the nineteenth century came to a close, "the foundations were laid against regimented instruction," in Los Angeles as elsewhere; "the concept of the pupil as the passive recipient, the sponge soaking up information in preparation of adult life, was abandoned. The broader concept of education as an integral part of the life process, of learning by doing through creative participation, slowly replaced the old accepted theory."[12] In subsequent decades, these evolving philosophies would also shift ideas about school plant design.

EFFECTS ON SCHOOL BUILDINGS AND CAMPUSES

It took time for school plant design to catch up with evolving educational methods. As noted Connecticut school architect Warren Richards Briggs (1850–1933) argued in 1906, "no one will deny [that] the public system of education has been carried in our country during the last half century to a degree of perfection heretofore unknown to any country of the world." Yet, he wrote, "can it be said, however, with equal assurance that our school buildings have kept pace with our educational systems? Are they as complete in their design and construction as the educational system in its plan and equipment?"[13]

Among architects and educators it was widely recognized that reform and standardization were needed. During the late nineteenth century, especially in urban schools, systems for sanitation and safety "were less than ideal and varied considerably from location to location, with little in the way of regulatory oversight."[14] This area was the first to be widely studied and significantly changed during this time, as many resources were devoted to developing and improving health and safety standards and systems.[15]

In Briggs's 1906 book, *Modern American School Buildings*, the architect contributed one of many guides available for standardized schools. The scale of Briggs's schools remained imposing and monumental, with the entire school contained within a single, multistory building. But the new standardized schools offered the best building infrastructure available at the time, with improved heating, ventilation, and sanitation systems, as well as recommendations for the ideal size and configuration for windows, doors, emergency exits, and other features.

In the early twentieth century, the movement to standardize and improve schools gained momentum and took off in earnest. American school architecture "advanced from the low point of complete neglect to a high point of monumentalism. School buildings changed from small, shabby units to large, beautiful edifices, glorifying the people's devotion to education."[16] Education-related organizations and trade publications around the country helped forward the cause. Overall, urban school plants still tended to be imposing "big-block" institutions "designed to house as many students as possible."[17]

But the seed had been planted among a national network of educators and administrators that the classroom should be a comfortable, safe place. Advances in health and hygiene research translated into changes in school plant design. By the end of the nineteenth century, for example, a better understanding of ventilation and disease prevention, in particular for tuberculosis, affected approaches to fenestration and building siting and led to an increasing emphasis on cross-ventilation. Overall, the issue of how to design the most healthy and efficient school remained the topic of intense study and debate, as these ideas continued to evolve through the first quarter of the twentieth century.

LOS ANGELES CITY SCHOOL DISTRICTS | DEVELOPMENTS AND CONTEXT

As elsewhere, the earliest schools in Los Angeles were utilitarian and vernacular in style, constructed to serve newly established communities emerging throughout the region during this time. Early schools were generally wood framed and sheathed, with a simple communal room or two serving all of the school's needs. The late nineteenth century was the era that "introduced the bell tower as a signature element of a school building, perhaps modeling school buildings on early churches."[18] Three late-nineteenth-century school buildings survive in Los Angeles.

As school buildings turned from vernacular, domestic-scaled forms to more monumental statements of civic pride, the model became Beaux-Arts Academic Classicism: "The Classical Revival was especially favored, and impressive porticos of colossal columns

proclaimed the importance attached to education."[19] School buildings came to resemble grand civic buildings, with monumental scale, classical styling, symmetrical design composition, and a rational program. Spanning the nineteenth and twentieth centuries, this era brought improved technologies and industrial-strength materials, allowing buildings to rise to two or three stories in height. Most of these buildings were unreinforced masonry construction—more fireproof, but also more vulnerable to earthquakes—and many of these schools were destroyed or damaged beyond repair by the 1933 Long Beach earthquake.

Formation of the Los Angeles City School Districts

In 1872, little more than two decades after California's entry to the United States, the Los Angeles City School District was founded. The timing of the district's establishment was tied to state legislation requiring, among other things, that each city in California create a board of education. In 1879, amendments to the state constitution gave cities the authority to establish school curricula and methods, and Los Angeles educators set to the task of developing a program of study for their new district. Curricular improvements and reform in Los Angeles, as elsewhere, remained the topics of ongoing debate and refinement throughout the late nineteenth century and into the twentieth.

Figure 38. Central School (1873) at Temple and Broadway Streets in downtown Los Angeles, 1931 photo (demolished). Source: USC Digital Archive.

As the new district was launched, two schools were constructed in the early 1870s. One of these was the wood-framed Central School, located at Temple and Broadway Streets (then Fort Street) in downtown Los Angeles. Constructed in 1873 for $25,000, Central School became home to the county's first high school, which occupied four rooms of the two-story building.

In a 1936 series of articles exploring "landmarks almost forgotten in the march of progress," the *Los Angeles Times* recalled that when the school was constructed, it was "so big and grand that they came from miles around to see it, quite the finest school south of San Francisco. Its lines were classic, and it had a cupola with a clock in it. … The teachers like the wide corridors and generous windows and the transoms over the doors. The earthquake, which did so much damage to newer school buildings, didn't harm the [Central] school in the least."[20] In 1882, Los Angeles's first teaching college, the State Normal School, was constructed downtown near the present-day site of the Los Angeles Public Library.

Early Currents of Change

One shift during this period was a growing sense that public education and schools should be a community affair, with a mission to serve the needs of the population. One example of this is seen in a citywide poll launched in 1900 by the Los Angeles Board of Education. With an extended list of questions, the poll was distributed to all city residents in order to solicit input on district curricula and teaching methods. The stated goal of the board in creating the survey was to initiate "the freest and most open discussion of public school work by all interested."[21] All citizens of Los Angeles were asked to offer opinions on the subjects taught at all grade levels, with a particular amount of attention going toward the newly established kindergarten program, as well as the amount of homework assigned and classroom conditions. After surveys were distributed throughout the city, results were tallied and discussed at a public meeting, in what would ultimately become an ongoing effort to solicit community input.

Similarly, in this era, a range of special-needs schools were established, including facilities for the deaf, blind, physically disabled, or cognitively impaired; special facilities were also provided for children suffering from tuberculosis. In addition, vocational schools with more hands-on, skills-related curricula were established in these early years. The 1904 Polytechnic High School was one example of this initiative.

The Boom of the 1880s and Los Angeles City Schools

In the 1880s, as has been well documented, Los Angeles experienced a significant population boom. One factor fueling this expansion was a speculative land rush, fueled by the completion of the transcontinental railroad and price wars between competing railway lines. The "boom of the 1880s" brought prosperity and development throughout Southern

Figure 39. Los Angeles's first teaching college, State Normal School (1882), downtown Los Angeles, in a circa 1900 photo. In the 1920s, this site became the location for the Los Angeles Public Library. Source: LAPL Photo Collection.

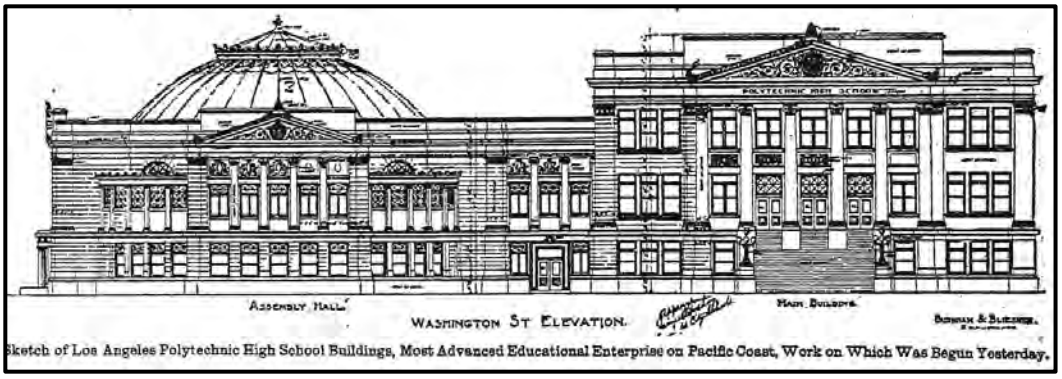

Figure 40. Elevation sketch of Los Angeles Polytechnic High School (1904), by Los Angeles architects Burnham & Bliesser. Source: Los Angeles Times, *July 9, 1904.*

California (though the boom had collapsed by 1890). Between 1880 and 1900, the population of Los Angeles expanded tenfold, growing from 10,000 to more than 100,000. In another decade, these numbers would triple, expanding to nearly 320,000 by 1910, greatly testing the capacity of the fledgling school district and board.

Although the district carried out an extensive building campaign during its first decade, keeping pace with population growth was a constant struggle. The city's schools quickly became overcrowded. As of 1874, the Los Angeles Board of Education recorded a total of six schools with nearly 900 students in the district. Within one decade, by 1884, the number of students within the district had nearly quadrupled, expanding to almost 3,500. By 1890, the Los Angeles Board of Education operated a total of 178 classrooms, which, in the spirit of the times, were classified not in terms of grade level but according to classroom capacity to house students.[22]

Figure 41. Neo-Classical Los Angeles Polytechnic High School (1904), Burnham & Bliesser (demolished). Source: LAPL Photo Collection.

Rapid population growth produced multiple problems for the fledgling Los Angeles Board of Education and school districts. Among them, according to the board's 1884 annual report, were a lack of scholastic uniformity among schools; significant gaps in the educational levels of pupils; crowded classrooms, which necessitated turning students away; and poor financial support. In addition, board president Frank A. Gibson "bemoaned" a governing structure by which state boards of education lacked the authority to issue bonds for school-building campaigns.[23] Within five years of the publication of this annual report, state policy changed. Cities were given the authority to issue bonds for municipal projects and improvements, including school construction. In

Figure 42. Grand, neo-classical high school beyond the city core: San Fernando Union High School (circa 1900), shown in a circa 1900 image (original location unknown). Source: USC Digital Archive.

1899, the City of Los Angeles sold bonds amounting to $200,000, generating proceeds for a turn-of-the-century building campaign for new schools.[24]

The funding provided through the bond measure temporarily helped ease overcrowding. However, the respite was short-lived. The board and district struggled to accommodate ever-expanding enrollment figures. Reflecting on the school year 1892–1893, the superintendent of the Los Angeles Board of Education wrote, "There seems to be no way to get entirely rid of these half-day schools in our rapidly and continuously growing city."[25] In the 1900s, this problem remained an issue, with rapidly increasing enrollment each year. Indeed, overcrowding continued to represent one of the most pressing challenges facing Los Angeles school districts throughout this era (and throughout the twentieth century).

Civic Pride and the Turn-of-the-Century School

On the city periphery, as undeveloped lands slowly gave way to residential and farming communities, utilitarian wood-framed schoolhouses continued to serve the needs of new communities. But in the city core, grand new schools reflected the city's economic and institutional success. In its first few decades, the district added many monumental large-scale schools. Designed by the city's nascent field of architects, the buildings were generally self-contained, multistory buildings exhibiting the palette of styles popular in the era, including late Victorian, Romanesque, Classical Revival, and Beaux-Arts styles. The district's educational facilities and slowly modernizing methods mirrored Los Angeles's transformation from an outpost of 10,000 in 1880 to a metropolis of nearly 320,000 by 1910.[26] Of the district's rapid growth, the *Los Angeles Times* noted in 1898 that

> while it is altogether unnecessary to draw comparisons, it may be said that there is no other city in the United States that can show a proportionately great increase in school population. To say that Los Angeles is proud of her school record and of the large and well-appointed buildings erected for the education of her children is but to repeat that which the parents of the children well know and appreciate. No expense has been spared in providing every modern acquirement.[27]

Figures 43. and 44. A rare remnant of the neo-classical era in school design: San Fernando Middle School, Auditorium, John C. Austin, architect (1916). Source: Heumann & Associates and SAIC for LAUSD.

On January 1, 1898, the *Los Angeles Times* took stock of a decade of expansion of the city's public schools, which by then included 57 facilities with nearly 400 classrooms, estimated in value at $1.25 million. The new, progressive tone was evident in the article. "Play is the business of childhood," the reporter wrote, so the new kindergarten facility is "the playschool for the little ones," with a day filled with varied arts and crafts activities. "By those simple methods, which afford an amusement rather than a task, the mind of the child is set in motion."[28]

The monumentality and beauty of the city's public schools were also celebrated as forwarding the cause of education. The fine buildings, along with updated classroom activities and subjects, would inspire the older pupil to attend school rather than "lie awake all night scheming how he might play hookey all next day." "How different it all is from days gone by," the reporter concluded wistfully.[29]

In this way, for Los Angeles, providing the most modern, up-to-date curricula and facilities became important symbols of the city's growth, economic success, and stature as an urban center worthy of comparison to San Francisco, its well-established rival to the north. With the 1908 groundbreaking for the Los Angeles Aqueduct, and the subsequent wave of land annexations to the city, the area covered by the Los Angeles City School Districts would expand even more in the 1910s and into the 1920s, bringing new challenges for the city's school districts.

B. PROGRESSIVE EDUCATION MOVEMENT: STANDARDIZATION AND EXPANSION, 1910 TO 1933

"One of the important functions of school architecture is to sell education to the public. This is accomplished by making attractive that side of education the public sees most."
—John J. Donovan, *School Architecture: Principles and Practices*, 1921

NATIONAL CONTEXT | DEVELOPMENTS

Throughout the early part of the twentieth century, Progressive Era reform inspired a broad restructuring of educational methods and curricula in the United States. Reform was guided by the theories of educators and philosophers such as John Dewey (1859–1952) of the Columbia University Teachers College. Dissatisfied with authoritarian teaching methods emphasizing passivity and rote learning—and factory-like schools—Dewey and others argued that a student's natural curiosity and real-life needs should shape the classroom environment and curriculum. Dewey and the Progressive Education Movement stressed "learning both abstract concepts and real skills through projects ... children should move freely through classrooms, use materials other than textbooks ... explore the physical world through hands-on projects."[30]

By the 1910s, the Progressive Education Movement had gained momentum. Educators and administrators interested in reform advocated for more hands-on, child-centered methods and curricula. Key to this movement was the notion that the classroom should flex to the needs of each student. Anthropologist William Henry Holmes (1846–1933) thus noted the change in 1912: "Within the past few years we have been coming to measure education by a new standard, the standard of individual achievement. This means that we have begun to differentiate the abilities of children ... not in terms of a general standard, but in terms of what each individual is able to do within the range of his own ability."[31] This new standard brought changes to classroom dynamics, school structures, and to schools themselves.

The 1910s in Los Angeles also brought a number of developments that ultimately affected public schools. In addition to the 1913 opening of the Los Angeles Aqueduct, the film industry settled in the Los Angeles area during this time, and its economic strength drew new residents. Also in the early 1910s, the region's first collegiate school of architecture was taking shape at USC. By 1925, USC began conferring the region's only professional degree in architecture.[32] This helped establish the city's architectural profession and culture by training architects and attracting faculty throughout the country.

During this period, the role of the public school also changed, with a greater focus on serving community needs. An expansion of specialized programs and facilities served new groups, including working teenagers and adults. The school plant itself also took on a greater role as a community-gathering place, with auditoriums, outdoor spaces, and public rooms sited and designed to double as gathering areas. Artfully designed and landscaped approaches and entrances to schools represented an acknowledgment of this change and the need for positive relations with the community. Summing up the changes to educational philosophy in the early twentieth century, W. H. Crocker (1861–1937), editor of *The American Architect*, wrote,

> During the past quarter century, each succeeding year has witnessed the broadening development of public education. The relation of the school to the community has radically changed. Systems of education have been evolved as the result of the careful observation of those engaged in pedagogy, and these systems have become broadened and extended. ... With this evolution and extension of educational methods it was logical to assume that the modern schoolhouse would keep pace in its designing and planning.[33]

On the right: Union High School in a circa 1915 photo. Located at 1521 N. Highland Avenue, the building is extant but significantly altered; it is currently in use as the Hollywood High School Museum. Source: LAPL Photo Collection.

In fact, modern schoolhouse design was initially slower to keep up with the times. But by the early 1920s, the Progressive Education Movement had brought significant changes to two main realms: first, teaching methods and curricula became more hands-on and individualized, less rigid and authoritarian; and second, environments for learning were transformed to facilitate these new ideas. As architectural historian Amy Ogata wrote, "Historians of education are still divided on the real impact of progressivism on American education, but its effect on the *architectural* discourse was profound and enduring."[34]

EFFECT ON SCHOOL BUILDINGS AND CAMPUSES

Educational philosophies and methods—and eventually schools themselves—changed substantially during this period. For their communities, school plants remained important symbols of civic identity and pride. The buildings were increasingly functional, but the wish to create beautiful temples to learning, reflecting the community's aspirations for itself and its youth, remained strong: "There is nothing more impressive or hopeful in American democracy than the devotion of the people to education. … Unconsciously the spirit has been to represent truly this national devotion to education in the architecture of public schools."[35]

As architects and designers began experimenting with the new ideas of this period, school plants became "more flexible and adaptable, and more accommodating of the new methods of teaching."[36] The keys became functionality, adaptability, and programmatic differentiation of buildings and spaces, for interiors and for the site overall. The increasing emphasis on natural light and fresh air brought the incorporation of bays of windows, which would march across the building elevations and span each floor of classroom wings.

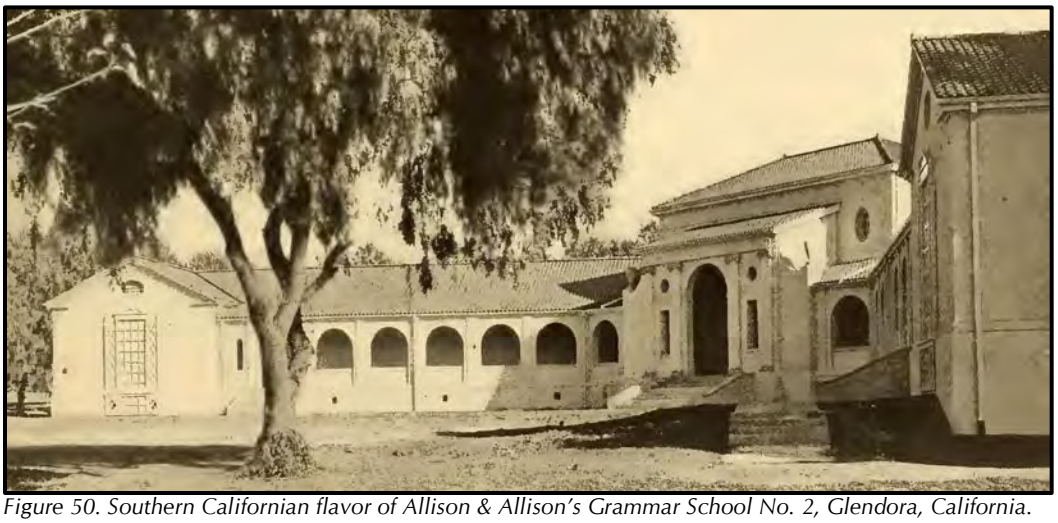

Figure 50. Southern Californian flavor of Allison & Allison's Grammar School No. 2, Glendora, California. Source: Donovan, 1921.

With a growing network of education-related organizations and publications, the push for modernization was a shared project for architects and educators around the United States. One of the era's most defining documents in this respect—one that became a standard office reference for architects—was John J. Donovan's 1921 *School Architecture: Principles and Practices*. Encyclopedic in scope, Donovan's volume offered a richly illustrated guide with the latest ideas in everything from construction to costs, campus planning and landscape development, to each feature of a modern school plant, whether vocational, elementary, junior, or high school. A wealth of drawings and floor plans illustrated the ideas described by Donovan and other school architects in the volume. In 1954, renowned school architect William Wayne Caudill referred to Donovan's book as "the 'bible'": "Any account of the architectural development of school buildings in the United States certainly would not be complete without a statement concerning the writings of Donovan."[37]

John J. Donovan's School Architecture: Principles and Practices

A native of Massachusetts and alumni of the Massachusetts Institute of Technology, John J. Donovan (1876–1949) moved to Oakland, California, in 1911 to supervise the construction of Oakland City Hall. Donovan resided and practiced in Oakland for the rest of his career, completing many high-profile commissions including libraries, schools, and infrastructure projects. Although he lived and practiced in Northern California, Donovan's book became a standard reference throughout the United States.

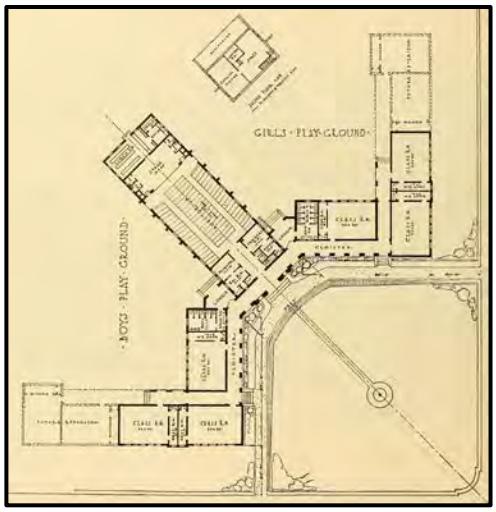

Figure 51. Open-air plan, Allison & Allison's Grammar School No. 2. Source: Donovan, 1921.

Figure 52. Open-air classrooms in northern and southern California. On left, Leland Stanford Jr. University Elementary School, Palo Alto, California. On right, Francis W. Parker Elementary School, San Diego, California. Source: Donovan, 1921.

Shift away from Monumental Scale and Beaux-Arts Classicism

Donovan documented and proposed examples of how to plan for the new school. In terms of scale, the schools were less monumental, less imposing. For primary grades especially, Donovan wrote, "Vainglorious attempts to build monumentally are fatal to both child and adult, for instead of attracting the child's interest they are most likely to repel and make fearful." Rather, he continued, "the architecture of the elementary school should be symbolic of quiet simplicity, expressing in permanent materials much the same charm that the little child has for those who appreciate and love children."[38]

Stylistically as well, from the 1910s through the 1920s, there was a move away from Beaux-Arts Classicism and Classical Revival styles toward the period-eclectic styles commonly used in domestic architecture. The significant innovations and departures from earlier eras were in building plan, layout, and interior program. Using a range of national examples, Donovan's illustrations and narrative showed a new approach to school design that was focused on artful, functional site planning, and coordination of campus buildings.

During this time in Southern California, as in many other parts of the region, architecture was entering a golden age. Responding to the boom in construction, architects and designers were both meeting and fueling demand for the menu of period-eclectic styles popular at the time. In Southern California, architects drew on the heritage of the region, including the Arts and Crafts movement and Spanish Colonial past, to forge a unique architectural identity.

Importance of Indoor-Outdoor Integration

One of the most significant shifts during this era was the emphasis on outdoor spaces in schools. In 1910, in another guide for designing "modern" schoolhouses, architect Alfred D. Hamlin observed that "however perfect the heating and ventilating plant, and however faultless its operation, let it be clearly understood and always remembered that no artificial

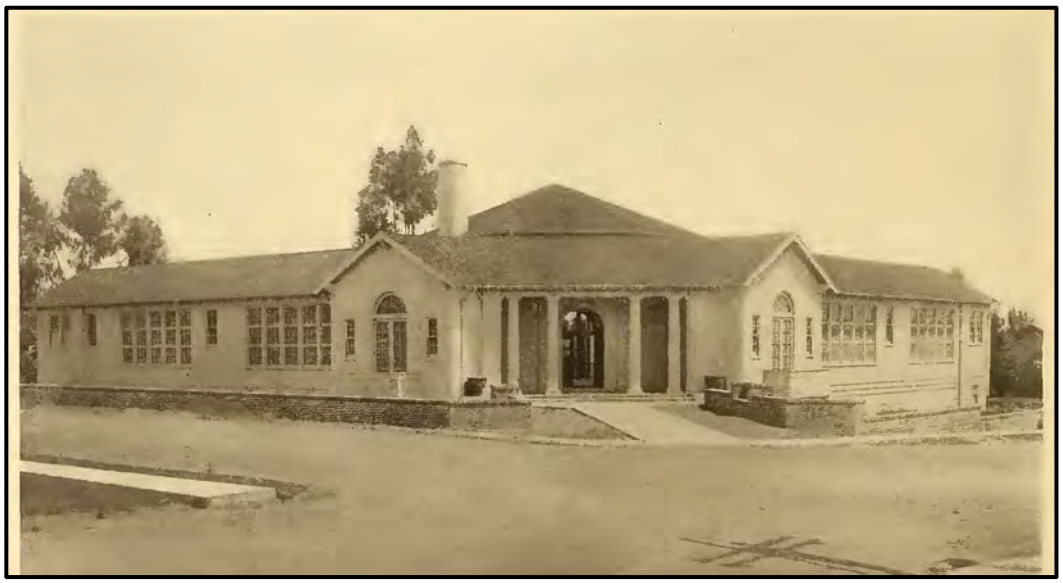

Figure 53. A lack of monumentality, low scale, and U-shaped plan characterize John J. Donovan's Stanford University Elementary School, Palo Alto, California. Source: Donovan, 1921.

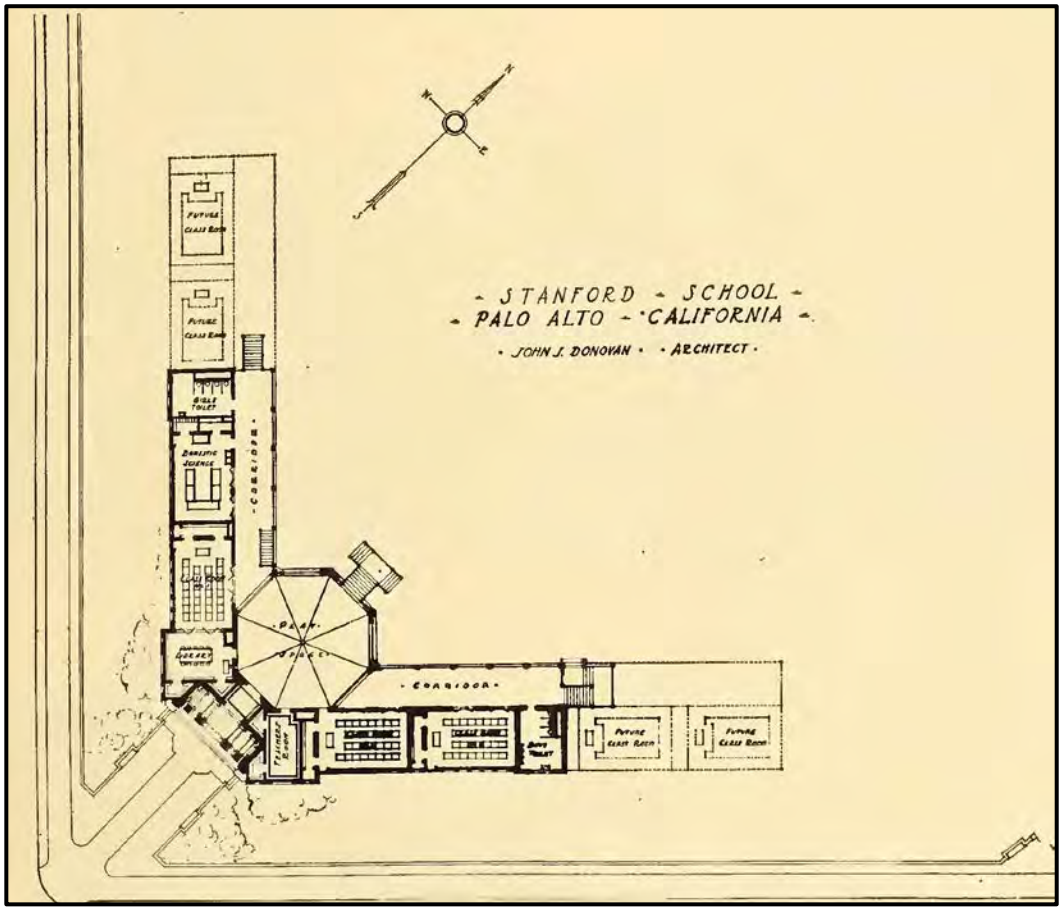

Figure 54. U-shaped campus plan, Stanford University Elementary School, Palo Alto, California. The plan allows for easy indoor-outdoor spaces as well as expansion as the school grows. The locations for four "future class rooms" are sketched in at each end of the plan. Source: Donovan, 1921.

heating and ventilation can ever take the place of fresh outdoor air and sunshine."[39] Rapid urbanization throughout the United States brought increased acknowledgment of the need for and benefits of outdoor activities. During this era, Hille wrote, "Connections to the out-of-doors were important for reasons of health and hygiene, providing access to natural light, fresh air, and exercise, and places for new kinds of learning activities."[40]

These ideas translated into clear changes in school design. Plans became "more open and interconnected, with more transparency and spatial complexity—both inside and out."[41] Schools capturing these ideas in particular abounded in Donovan's book. Simple changes to the traditional big-block school, such as adding adjacent or parallel wings, created numerous possibilities for outdoor spaces. The school branched out and turned in on itself, with building plans including elongated L shapes, T shapes, H shapes, or U shapes, all of which spread out the interior program and opened up possibilities for courtyard spaces and interconnections.

Many of the examples Donovan used to illustrate the latest ideas were drawn from Northern and Southern California. As Donovan said of these Californian schools, "Elevating the building and spreading its area over more ground brought forth many interesting developments in plan of single units and groups of units which of course led to delightful exterior compositions of the modified Romanesque, Spanish, Italian, English, and modern Renaissance. Thus it is that the school architecture of California has found a permanent spot in the sun."[42]

In this respect, California led the way. With its relatively mild climate—not to mention rapidly growing population, need for new schools, and room to grow—Southern California in particular was an early proving ground for the open-air campus and school. (For the region's residential architecture as well, outdoor living came to exemplify the good life and contemporary design in the "Californian" mode, a label that itself was becoming a marker for the latest ideas.)

This was an idea promoted by the Los Angeles school district officials as well. In 1911, M. C. Bettinger, assistant superintendent of the Los Angeles City School District, told the *Los Angeles Times* that in the city's schools "the custom of studying and even reciting out of doors is growing. The children take their books and go out under the trees, sit on the benches or the ground."[43] Bettinger said, "In my district I heartily encourage this custom." He evoked the language of reform when he declared that outdoor study provided a means of "getting away from the factory system of education. … This is especially desirable in the lower grades, when the children grow restless, and look longingly out toward the fields and the hills."[44]

Site Planning and Layout

Unified site planning, the incorporation of landscape architecture, and a spread-out campus became increasingly important in this era. These qualities enhanced patterns of circulation, created more outdoor gathering spaces, and built connections between campus buildings based on use. Spreading out the plan, Donovan wrote, created "many opportunities for pleasing courts, and approaches, at the same time furnishing to the plan spaces for lawns, shrubs, trees."[45]

Because of the acreage requirements for an extended campus plan, though, such schools were often added on the city periphery. Donovan wrote, "The trend of the times is to locate secondary schools in sparsely settled sections of the cities where the buildings may be spread out and their height reduced. This is desirable, as it means better lighting, better natural ventilation, fewer fire hazards."[46] This was the case in Southern California as well, with many examples of open-air campuses located in what were, at the time, the expanding suburbs beyond the city core. This trend in campus planning also made school plant design, planning, and construction an interdisciplinary project, involving teams of architects, landscape designers, and school facilities personnel.

Buildings were designed with generous setbacks, taking into account adjacent traffic to ensure that classrooms were adequately buffered from street noise. More comprehensive site planning also allowed architects and school planners to think ahead to future expansion needs, in terms of both individual buildings that could be expanded and buildings and structures that might be added.

Figure 57. Garfield High School (1925), in 1929 photo. While the campus still occupies this site, very little of the original campus appears intact. The notion of campus planning was becoming more important as well, especially for upper grades. High schools were expected to be "about double the size" of junior highs, with the "character of the college campus": "The day has arrived when high schools are being planned as groups of buildings, not more than two or three stories high, with the different departments in separate buildings connected by open or inclosed arcades or wings."[47] This trend was best suited to expansive lots, though, rather than dense urban environments. For urban schools without much acreage to work with, multiple stories were often necessary, with classrooms organized in blocks with adjacent wings and double-loaded corridors. Although Donovan conceded that in the "larger cities, due to the cost of land, it may be necessary to have the high school under one roof," his book illustrated how variations in plans and programs still created opportunities for visual interest and outdoor spaces.

In addition to limited acreage, limited funding played a role in determining how far a campus could spread out across a site. Resources were not always available to design and construct an entire campus. In the Los Angeles city school districts in this period, buildings would be added as enrollment increased, usually starting with the administration building—usually the flagship building of the campus—and classroom wings, then eventually including additional classrooms, a cafeteria, and a gymnasium, depending on the grade level of the school. Purposeful site planning also allowed architects to factor into their designs the patterns of the sun and interior illumination, in order to make the best of natural light in the classroom.

According to Donovan, as of 1921, the finer points of building siting, orientation, and interior lighting had been "carefully documented and thoroughly understood by architects at the time."[48] Conventional wisdom held that window areas should equal approximately 40 to 50 percent of the total wall area of the room's longest side. Windows would extend up to 6 inches from the ceiling, to maximize light. In this way, the repetitive bays of windows, on

each floor with classroom space, became one of the trademark features of 1920s schools in particular. Views out the windows were also considered important, because students should have the chance to look out the window and "rest their eyes at times."[49] Ceilings also tended to be high, ranging typically from 12 to 15 feet, "a minimum standard that in many places was regulated by building codes."[50] High ceilings helped with ventilation and accommodated tall windows, which provided the main light source until the advent of fluorescent lighting in the 1930s.

LOS ANGELES CITY SCHOOL DISTRICTS | DEVELOPMENTS AND CONTEXT

Building Program

During this time in Southern California, the boom in construction and resources brought a golden age for period-revival architecture. Buildings reflected a wide palette of styles and stylistic hybrids; schools exhibited the ornamental programs of Romanesque, Italian Renaissance, Spanish Colonial, and Collegiate Gothic Revival styles. In terms of materials, schools during this period were generally, though not always, of masonry construction. Brick was a popular structural and decorative cladding material, as were hollow clay tile and concrete, the latter often manipulated to resemble stone or other materials.

While the 1920s boom provided opportunities to test new ideas, the era remained transitional, with some new construction showing the new lower massing and open site plans recommended by Donovan, and some schools still adopting a more monumental decorative program and higher massing. As elsewhere, the most common building plan types during this period were increasingly rectilinear with perpendicular wings in T, H, and U shapes, providing areas for courtyards and outdoor spaces. Ordinarily the interior would consist of classrooms lining a double-loaded corridor.

Construction generally unfolded in phases as school enrollment grew. Between the mid-1910s and 1930, elementary schools, for example, were typically constructed in three stages. The first stage usually brought an administrative office, the flagship building of the school, as well as a kindergarten and a nine-classroom wing. The second stage took place once enrollment reached 400, with the addition of more classrooms, facilities for home economics and manual education, and a cafeteria. When enrollment reached 900, the third stage took place, which usually brought a new auditorium, classrooms, or other service rooms as needed. Kindergartens tended to be self-contained and separate from other classes. Gymnasiums, shops, and specialized facilities for home economics, wood shop, and other coursework were also added for junior high and high schools.

During this era, newspapers of the day reflected much civic pride in—and promotion of—the city's new public schools. In 1914, when Los Angeles's public schools were singled out as "models for the rest of the state" (in comparison with San Francisco's schools, which were declared substandard), the bragging rights this conferred made news in the *Los Angeles Times*:

> A city is known by the schools it keeps and nobody can ignore the fact that Los Angeles owes no small measure of her astonishing growth, her rapidly increasingly wealth and commercial stranding, her desirable American population, to the acknowledged high efficiency of her public school system.[51]

Keeping up with ever-expanding enrollment figures remained a struggle, however. By the end of the 1910s, high enrollment and little funding for new facilities had again led to overcrowded classrooms and the need for half-day sessions. In April 1919, the Los Angeles Board of Education took temporary measures, building 30 bungalows to relieve the overcrowding, in advance of bond funding for a wider building campaign.

Figures 63 and 64. Spread-out plan and Renaissance Revival style of University High School (1924), west Los Angeles. Source: LAUSD University High School Pre-Planning Survey, 2011.

The 1920s brought dramatic expansion in school construction. By 1927, $60 million in bond issues had been sold for the construction of new schools, as well as additions to existing facilities. More than 200 permanent facilities were constructed in 6 years. As a reporter for the *Los Angeles Times* wrote in 1927,

> Los Angeles is in many respects such a super city that it is difficult to write about her without using superlatives. In speaking of her public schools, however, one may be pardoned—especially an outsider—for according them high praise, since they are the product of teachers and officers who are laboring unselfishly for the public good.[52]

Alfred S. Nibecker Jr. and the District Architecture and Building Department

Guiding the Los Angeles school districts through rapid expansion in 1920s, disaster and depression during the 1930s, and the great postwar boom through the mid-1950s was district architect and business manager Alfred S. Nibecker, Jr. In the 1920s, Nibecker began private practice in Los Angeles; he joined the Los Angeles City Board of Education as an architect in 1926, where he remained until his retirement in 1955. In his three-decade career with the school district, Nibecker oversaw the construction of, and contributed designs to, hundreds of school plant projects. Many commissions were completed by the district's in-house staff, but many others were handled by a range of the region's best architects and builders, with an increasing number of firms specializing in school design. In addition to his work with the Los Angeles City school districts, Nibecker was a fellow of the American Institute of Architects and served on the National Committee on School House Construction, the National Advisory Council on School Building Problems, run under the auspices of the U.S. Department of the Interior, Office of Education. In 1955, Nibecker was made an honorary member of the Structural Engineers Association of Southern California, the association's highest award.

Building Code Reform

New building codes attempted to keep pace with the construction boom and ensure safety. In 1914, with the focus still on fire hazards, Los Angeles voters approved a law requiring the replacement of wood-framed schools with masonry structures. Of course, the vulnerability

of masonry construction to earthquakes was not yet fully known. Therefore, most schools constructed in Los Angeles post-1914 utilized masonry construction, with brick construction used for a majority of the new schools.

In 1925, in response to the devastating Santa Barbara earthquake, the state adopted new building codes aimed at strengthening seismic safety. In 1927, the City of Los Angeles followed suit and revised its local building ordinance and added supplemental steps and requirements to ensure the structural stability of schools. Improvements included fire-resistant corridors, stairs, and exterior walls and reinforced concrete beams within floors and roofs. When the March 1933 Long Beach earthquake hit, schools built after 1927, under the new requirements, proved more resilient than those constructed before the laws took effect.

As before, the new schools of the district generated much civic pride, with newspapers of the day praising new campuses for their beauty and modern facilities. As *Los Angeles Times* reporter Neeta Marquis wrote in 1928, "Let us of Los Angeles who often grow depressed at times over the inadequacies of our city administration in other departments take heart of grace from the efficiency and stability of the factory which is turned out our citizens of tomorrow, our public schools."[53]

The Roaring '20s and Enrollment Expansion

The basic shift in philosophy coincided with the continuing, remarkable expansion of Los Angeles, not only in terms of population growth but also geographical range. In anticipation of the ample water supply promised by the Los Angeles Aqueduct, constructed between 1908 and 1913, Los Angeles experienced rapid population and land growth through annexation of neighboring cities. As of 1910, the population of the City of Los Angeles stood at 319,000, and the area served by the Los Angeles City School District spanned more than 85 square miles, with more than 46,500 students enrolled. Within just 6 years, by 1916, enrollment in the Los Angeles City School District had nearly doubled to more than 78,000 students, and the expanse of the district quadrupled, growing from 85 square miles

to approximately 400.[54] Some areas annexed by the Los Angeles City School District already had schools to serve their own needs; more often, though, new schools were required. Between 1911 and 1915, a total of 22 schools had been annexed to the district, with an additional 31 elementary and high school buildings under construction.[55]

During the boom of the 1920s, Los Angeles film and aeronautics industries remained strong draws for new settlers. In one decade, between 1920 and 1930, Los Angeles's population doubled, climbing to 1.2 million, making the city the fifth largest in the United States. At a high point during the 1920s, new residential subdivisions were being established at the rate of 40 per week in the City of Los Angeles. By 1930, Los Angeles spanned 441 square miles.[56] This represented a twelvefold expansion in 30 years.

Concurrently, Los Angeles's public school enrollment grew nineteenfold during the 1920s. The construction boom in schools helped accommodate the enrollment increase, but the need for new schools and classrooms remained a constant issue. By 1933, the Los Angeles City School District included a student population of 300,000, attending 384 schools—293 of them elementary schools; 22 junior high schools; 32 senior high schools; and continuation, trade, and junior college facilities rounding out the remainder.[57]

Curriculum Shifts

The Los Angeles City school districts followed the curriculum modernization and reform trends seen in the rest of the United States. By the early 1910s, the city's public schools had made a decisive move "away from the uniformity that was so much prized at the turn of the century. Diversification now marked the schools and the officials made that fact known."[58]

The heart of reform was designing curricula that flexed according to the students—their abilities, needs, psychological well-being, and their inherent curiosity and love of learning. For example, the new course of study in elementary schools was based on the idea that

Figure 69. Central Junior High School, as of circa 1925. Located in downtown Los Angeles on Hill Street, this school closed in 1946. Source: LAPL Photo Collection.

"individuals should progress in accordance with their individual capacities" and was organized in "large units with the activity approach emphasized throughout."[59]

In 1911, Los Angeles established a new intermediate level for schools, launching the third junior high school system in the United States, behind Columbus, Ohio, and Berkeley, California. Vocational schools and junior colleges (as an extension of the high school curriculum) were also greatly expanded in this period.

Social Responsiveness and a Broadened Mission for Public Schools

In Los Angeles and elsewhere, this era saw a broadened role for public schools as community centers. Public education became more inclusive and socially responsive to underserved populations. During the first quarter of the twentieth century, a range of special-needs schools were established, including special facilities for the deaf, blind, physically disabled, or cognitively impaired; special facilities were also provided for children suffering from tuberculosis. National trends and legislation prompted the establishment of evening high schools, for adults seeking to broaden or finish their education; part-time high schools, to help meet the new requirement for working children between the ages of 14 and 18 to attend school part time; and vocational schools. Cafeterias and nurseries became part of schools—the first for nourishment, and the second to ensure that older children tasked with caring for younger siblings could attend school while their parents worked. Schools also offered assimilation and language programs for the city's significant immigrant population.

The first evening high school opened in 1907 in Los Angeles at the Polytechnic High School. Offered initially as a means for working adults to obtain a high school education or diploma, night schools blossomed in popularity; and by the post–World War I period, they served as informal community centers, with offerings expanding to include a variety of course offerings.

Legislative Reform and Public Education

The two other major changes to Los Angeles's public schools were prompted by legislation at the state and federal level. Beginning in the early 1910s, legislation began emerging throughout the United States making part-time school compulsory for teenagers. The first such law was introduced in Wisconsin in 1911, with California following in 1919.

In 1913, a presidential commission was formed to assess the need for vocational training throughout the United States. One of the results of this commission was the 1917 Smith-Hughes Act, which, among other things, initiated new compulsory education requirements for school-aged children and provided federal funding for vocational schools and coursework, in particular in agriculture. In Los Angeles, specialized vocational training had been available as early as 1905, with Polytechnic High School. Throughout the early part of the twentieth century, technical schools offered specialized coursework, such as commercial courses at Polytechnic, industrial and household arts at the Manual Arts High Schools, and agriculture at Gardena High School.[60]

The state law that emerged from the Smith-Hughes Act required that all working children between the ages of 14 and 18 attend a minimum of 144 hours of class instruction per year.[61] In 1920, in response, Los Angeles public schools launched a program in part-time education, making use of "a large number of rented locations."[62] In 1926, Los Angeles's largest part-time high school—aptly named the Part-Time High School—became Metropolitan High School (located at 234 W. Venice Boulevard in Los Angeles, the campus became the Los Angeles Metropolitan Junior College in 1950).

Figure 70. Frank Wiggins Trade School, circa 1925. Located in downtown Los Angeles on Olive Street, this school closed in 1951. Source: USC Digital Archive.

The Frank Wiggins Trade School, the first of its kind in the district, was established in 1925 on Grand Avenue in downtown Los Angeles (though it was relocated in 1927 to South Olive Street). Named for the longtime secretary of the Los Angeles Chamber of Commerce, the Frank Wiggins Trade School provided a course of adult education in specific vocations and placement of students in the

occupations for which they had been trained. Among its other curricula, the school offered the first professional culinary training program in the nation, an offshoot of the home economics program. The trade school evolved into the Los Angeles Trade-Technical College, still operational today as part of the nine campus, 882-square-mile Los Angeles Community College District.

The establishment of the District's first junior college in 1929 was represented as the crowning accomplishment of the administration then in office. The school district purchased the Vermont Avenue campus of the former State Normal School when it relocated to Westwood and established the Los Angeles Junior College, which was an immediate success. The curriculum constituted the freshman and sophomore years of college and included semiprofessional courses for students interested in a 2-year education, as well as certificate work for those planning to qualify for subsequent admission to a university.

Together with trade schools, junior colleges filled an important social need by supplying focused adult education and career training during the Depression years, and enrollment steadily increased as the war approached.

C. ERA OF REFORM: GREAT DEPRESSION, EARTHQUAKE, AND EARLY EXPERIMENTS IN THE FUNCTIONALIST SCHOOL, 1933 TO 1945

"The old school was primarily designed to impress the adult and the new school primarily designed to impress and provide comfort to the pupil."
—William Wayne Caudill, *Better Design for Schools*, 1954

NATIONAL CONTEXT | DEVELOPMENTS

In the simple epigraph above, architect William Wayne Caudill (1914–1983) captured the evolving ideas about twentieth-century school design. Traditional schools had often been built as self-contained, monumental blocks, in Classical Revival and Beaux Arts–inspired styles designed to impart prestige. In the first quarter of the twentieth century, reformers started moving away from the multistory, block-style school in favor of a more flexible, program-differentiated school plant.

Figure 72. Indoor-outdoor classroom, Corona Avenue Elementary School, Richard Neutra, 1935. Extant in Bell, California, south of Los Angeles. Source: USC Digital Archive.

The reform movement was not concerned with bringing modernist style, per se, to school plant design. The real push was for a more "functional" school. If the function of a school was educating children—and if educational methods and curricula had improved and evolved—then school plant design had to evolve as well. Building plans, campuses, and interiors were increasingly designed to be more child-centered and flexible: "The broadening curriculum, the more active methods of learning, and emphasis upon doing and working with things rather than merely studying books—all have focused attention upon the importance of the physical environment."[63]

Continuing the trend begun in the 1920s, integration of classrooms with the outdoors became one key factor for school plant improvement. The early-twentieth-century recognition of the importance of children's playgrounds and an increasing emphasis on the benefits of outdoor living fueled this movement. Wrote Elizabeth Mock in 1943, "If we grant the importance of encouraging the child's awareness of nature along with his sense of freedom, we can then understand the present tendency towards ground-level classrooms, each with its own door to the outside and its adjacent outdoor class area."[64]

Numerous proposals were forwarded for including more indoor-outdoor connections for classrooms and campuses, whether through the use of patios, courtyards, or playing fields. So central was the concern for outdoor classrooms and recreation that, by the 1930s, the trend became known as the "open-air school" movement, with its emphasis on "air, light, outdoor learning, and easy circulation through the school buildings."[65] Site planning was also carried out with an eye toward environmental factors, such as sun patterns, interior cross-lighting, and ventilation. With its mild climate and room to grow, Southern California pioneered some of the nation's best and earliest examples of open-air schools in the 1930s.[66]

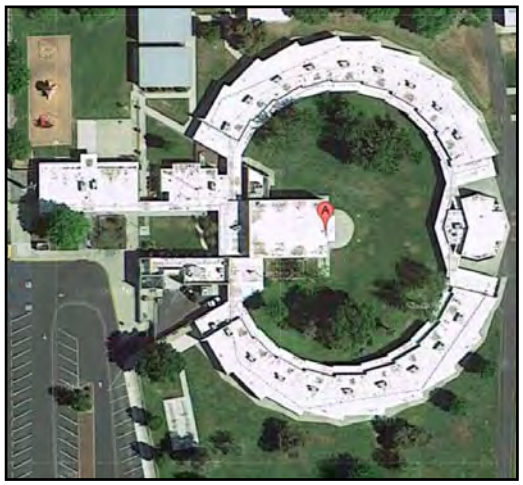

Figure 73. Richard J. Neutra School, Lemoore, California (Central Valley), 1960, based on Neutra's 1928 design. Source: Google Maps, 2013.

As in the 1920s, schools continued to play an increasingly important role as gathering places for the community. This was reflected in campus site planning, with auditoriums sited for public accessibility and separate entrances allowing for school-time access by the public that would not interrupt studies. Architects, designers, and school staff actively sought ways to adapt schools to this expanded function within the community, and innovations in this regard were amply noted in the education- and architecture-related trade magazines.

In the 1930s, an expanding field of research in the building sciences aided those tasked with designing comfortable classrooms for children. Controlling, designing for, and regulating the environmental conditions of classrooms became the topic of numerous studies, including in the science of proper lighting, ventilation, and safety systems (the field of acoustics came into play in the postwar period).

A new focus on defining and better understanding building typologies and their specific needs also grew out of this era, with the idea of creating better environments and lowering costs through standardization.[67]

Figure 75. Thomas Jefferson High School, Stiles O. Clements, 1936 image. Extant in south Los Angeles, on East 41st Street. Source: LAPL Photo Collection.

By the mid-1930s, the advent of the New Deal and the PWA (later the Works Progress Administration) sponsored a generation of new building. Throughout the United States, PWA funding helped buoy school construction during the Great Depression, with approximately 70 percent of all new school construction in the 1930s funded through the agency.[68] In Southern California, following the 1933 Long Beach earthquake and the urgent need for new facilities (described in detail below), PWA funding for school construction and reconstruction totaled over $13 million, a sum accounting for 62 percent of the spending overall.[69]

Throughout the United States, PWA buildings, including dozens of schools, became known for their distinctive Streamline Moderne styling. In Southern California, Streamline Moderne ideas were also applied to historic-eclectic styles that had been popular in the 1920s, creating new stylistic hybrids.

EFFECTS ON SCHOOL BUILDINGS AND CAMPUSES

The Functionalist, Modern Movement in School Design

By the 1930s, progressive educational reform had brought major changes: teaching methods and materials were becoming more hands-on, practical, and engaged; and the environments for learning were themselves transformed to facilitate the new ideas. As architectural historian Amy Ogata wrote, "Historians of education are still divided on the real impact of progressivism on American education, but its effect on the architectural discourse was profound and enduring."[70]

Compared with school buildings and campuses just a decade before, schools were increasingly nonmonumental in their scale, site plan, and design. One-story buildings were increasingly used for all grade levels, in particular for elementary schools. In a companion piece to the Museum of Modern Art exhibit *Modern Architecture for the Modern School*, Elizabeth Mock wrote in 1943 that "if the architect is guided primarily by his desire to create a building for children, the result will almost certainly be a one-story school, built as close to the ground as possible. This is the easiest way to open each room to the outside, and the easiest way to attain suitable scale."[71]

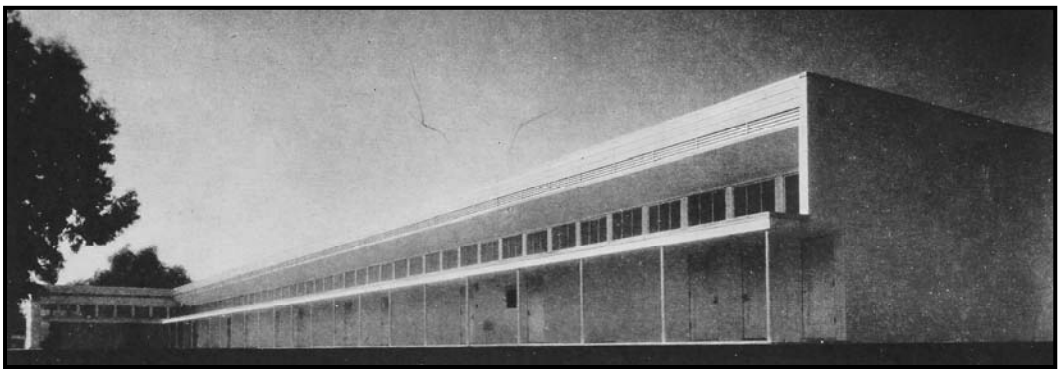

Figure 76. Richard Neutra's Corona Avenue Elementary School addition, 1934/1935. Extant in Bell, California, southeast of downtown Los Angeles. Source: Built in USA, 1944.

The emergence of modern architectural design provided a quantum leap forward for this new wave of reform. Modernism embraced honesty in structure and materials and a functional design driven not by a given style or ornamental program but by the building's purpose. By the postwar period, this debate had been settled, and modernism did become the preferred (though not exclusive) idiom for American school plants. But in the 1930s, this movement, which brought together ideas about educational reform, modern architecture, and research in building sciences, was just taking root.

William Edmond Lescaze

One architect who actively advocated for a more modern, functional approach to school design in the 1930s was William Edmond Lescaze (1896–1969). Between 1929 and 1932, Lescaze, along with partner George Howe (1886–1955), designed one of the era's most significant modern buildings in the United States, the Philadelphia Savings Fund Society building, considered to be the country's first example of a skyscraper in the International Style.[72] In the mid-1930s, Lescaze published articles in architectural magazines as well as specialized education-related trade journals to argue for more functionalist, modern schools:

> If buildings have an influence on us, should we not insist that our school buildings work well, and be good looking? Of course we should. But do they work well, and are they good looking? Alas, no! Most of the schools are massive, uninspiring, uninviting buildings. Pediments of limestone, a few columns and, when we can afford them, a tower or a cupola! Just as you may order lettuce salad with French dressing or mayonnaise, you may have a school building Gothic or Colonial!
>
> There can be no school planning worthy of the name unless the functions of the building are clearly understood, clearly expressed: and that understanding, expressing clearly the functions of a building, has been achieved by all good architecture in the past, and is what modern architecture is today attempting to achieve.[73]

Figure 77. Corona Avenue Elementary School, 1935. Source: LAPL Photo Collection.

Figure 78. Same outdoor classrooms, circa 1950. Source: Getty Research Institute, Shulman Archives.

The key to this, Lescaze argued, was moving beyond historic eclecticism:

> Modern functions cannot be fitted into old forms, nor can twentieth-century "uses" be combined with twelfth-century "beauties"! The buildings of the past are beautiful not because they are a "style." They are beautiful because the men responsible for them devoted all their skill, their taste, their understanding, to fulfilling the purposes, the functions, of these buildings. In other words, these buildings grew out of the life of their time, to meet the requirements of their time. And that is exactly what our buildings must do.[74]

Richard Neutra

As of 1936, Lescaze wrote, there was only one truly modern school building in the United States: Richard Neutra's 1934/1935 Corona Bell Elementary School in Los Angeles. Like Lescaze, Neutra (1892–1970) was European-born and educated and had come to the United States in the 1920s. Neutra had long been working on the problem of the modern school plant, with a philosophy steeped in Progressive-era notions of deinstitutionalizing the classroom. As Esther McCoy wrote, Neutra's ideas about school design

> grew out of the conviction that tensions begin to accumulate in a child when he is taken from the home and living room into a school and classroom, to be moored to the floor, and forced to look up at a teacher sitting above him on a platform. … Neutra saw great advantages in classrooms, especially for elementary grades, which resembled living rooms filled with group action—but a living room such as only a handful of architects had conceived at that time, one connected to a patio by a movable glass front.[75]

In 1928, Neutra had proposed a ring-plan school consisting of an outdoor, sheltered corridor providing circulation and access to finger-like classroom wings separated by landscaped patios and gardens. The elliptical plan was inventive and practical, as it made use of a compact lot and shortened distances between classrooms. (The plan was radical for 1928 but perfectly in the spirit of the times by 1960, when it was constructed as the Richard J. Neutra School by Neutra and his partner Robert Alexander in Lemoore, California.)

Figure 79. Emerson Junior High (now Middle) School, Richard Neutra, 1937, Los Angeles. This school is extant and located on Selby Avenue near Santa Monica Boulevard in west Los Angeles. Source: Julius Shulman Archives, J. Paul Getty Trust, Getty Research Institute.

Figure 81. Richard Neutra's Emerson Middle School (1937), extant, west Los Angeles. Source: LAPL Photo Collection.

In 1934, Neutra was given the opportunity to translate theory into practice. In the wake of the Long Beach earthquake, the architect was chosen to design an addition for the Corona Avenue Elementary School. His simple, L-shaped plan quickly became a prototype for Californian (and American) schools and "a classic in its field."[76]

The addition consists of a linear, one-story wing of single classrooms. On one side, covered passageways provide circulation corridors and, as Esther McCoy noted, evoke the arcades of Spanish Colonial architecture. On the west elevation, sliding glass walls provide direct access to outdoor play areas and classrooms. Landscaping creates divisions between classes, and 6-foot roof eaves provide shelter and transitional space. With this, Neutra perfectly melded outside and in and presaged the ways in which postwar architects would create seamless indoor-outdoor spaces.

The construction system of earthquake-friendly wood framing with generous expanses of single-pane windows adds to the sense of weightlessness and integration with the site. With a band of high clerestories on one side and full-length windows on the other, Neutra controlled classroom illumination and provided cross-ventilation. As McCoy wrote, the Corona School "banished the 'listening classroom,' which had its effect upon education methods, for the teacher became a part of the group as soon as students were no longer restricted to fixed seats."[77]

As the decade progressed, the ideas of architects like Lescaze and Neutra started to take hold. In 1937, Neutra designed a second pioneering example of a functionalist school plant, with the steel-framed Ralph Waldo Emerson Junior High School in Los Angeles. In this school, the architect continued the same themes of indoor-outdoor integration on a more constricted urban site. Emerson Junior High's "basic plan organization and massing are clearly expressive of function, with classrooms efficiently organized along double-loaded hallways in freely arranged wings. … The restrictions of the site are compensated by Neutra's inventive plan, making use of outdoor spaces, like a rooftop, for outdoor access."[78] As with the Corona Avenue project, Neutra created seamless connections between classrooms and patios with movable walls and landscaping.

Franklin & Kump and Finger-Plan Schools

Beyond Los Angeles in this era, other prototypes that became influential in the postwar period were under construction. One of the most important of these was Franklin & Kump and Associates' Acalanes Union High School in Lafayette, California, east of San Francisco. Franklin & Kump's rational "finger-plan" school perfectly captured the ideas of the day and became the most common school plan typology in the United States in the 1940s.

Constructed in 1939/1940, Acalanes Union High School was designed for a large rural site, with one-story wings extending outward in finger-like wings. Classrooms consist of open lofts with adjustable plywood partitions dividing the interiors. The pavilion-like site plan, low scale, and finger-like classrooms provide ample opportunities for outdoor access.

As with Neutra's early experiments, Acalanes Union High School moved interior hallways outside, with sheltered outdoor corridors throughout the campus. A recessed terrace off the dining room provided outdoor seating areas for lunch, and lockers were installed on exterior walls. The finger-like plan also allowed for cross-lighting and ventilation for each classroom. To the north, students enjoyed outdoor views through full-length windows. To the south, bands of high clerestory lights provided balanced illumination without glare.

Modular design and construction allowed for easy expansion of the school as enrollment increased. The campus included a variety of facilities, including gymnasium and playing fields, workshops, dining room, a network of classroom wings, and a parking area, all

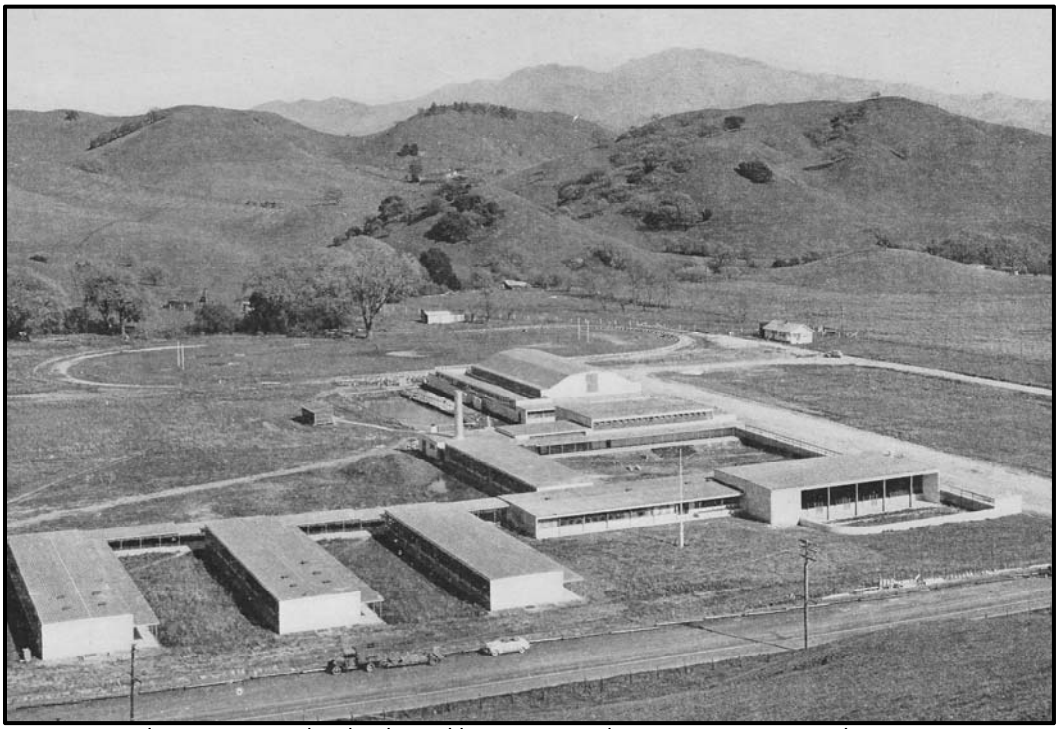

Figure 82. Acalanes Union High School, Franklin & Kump and Associates. Source: Built in USA, 1944.

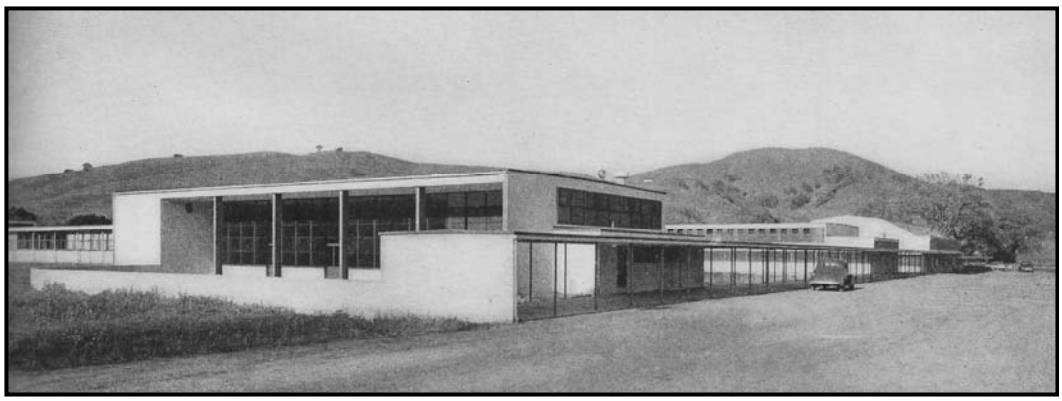

Figure 83. Franklin & Kump and Associates, Acalanes Union High School, Lafayette, California, 1939/1940. Source: Built in USA, 1944.

configured in a unified site plan. In keeping with 1930s planning trends, pedestrians and automobiles were separated through the use of a 500-foot-long canopied passageway, which connects the street and drop-off areas with the school entrance.

Although Franklin & Kump's school was published nationally on multiple occasions prior to 1945, it was in the postwar era that the school typology and plan took off. Pre-1945, Elizabeth Mock included the school in *Built in USA*, the Museum of Modern Art's 1944 exhibit and publication showcasing American regional modernism. Acalanes Union High School was one of only three other schools constructed between 1932 and 1944 included in the volume (Neutra's Corona Avenue project was among them).

Also included in the Museum of Modern Art's *Built in USA* was Eliel and Eero Saarinen's 1939/1940 Crow Island Elementary School in Winnetka, Illinois. Crow Island was another early experiment in how to interpret new ideas about education into function-driven, modern schools. The Saarinens, along with Perkins, Wheeler, and Will, proposed a domestic-scaled modular school, with an innovative pin-wheel plan, finger-like classrooms, plentiful opportunities for outdoor play, cross-lighting, and ventilation. This plan also was widely published and imitated in the postwar period.

Post–Long Beach Earthquake: The Era of the PWA Moderne | Streamline Moderne

Not all examples of the functional school plant were modernist in the sense of being antihistoricist. Most 1930s schools continued to display stylistic programs and ornamentation, though tastes had shifted to PWA Moderne, Streamline Moderne, Art Deco, and streamlined versions of historic-eclectic styles, such as the Spanish Colonial Revival. School plants embracing the new ideas might express their function clearly, with a differentiated, unified campus plan, but they might also display a specific style. These examples were widely praised and published as representative of the 1930's movement toward more functional school plants.

Several of the most significant Southern Californian firms to point the way forward in this regard on a national scale were James Edward and David Clark Allison; Sumner Spaulding and John Rex; Donald and John Parkinson; and Norman Marsh, David Smith and Herbert James Powell (later Marsh, Smith and Morgridge). During this era, these firms, among others, participated actively in school construction, designing more functional, child-centered, open-air schools that were also historicist to varying degrees.

In the postwar period, Spaulding & Rex, Marsh, Smith & Powell, and the successor firm to the Parkinsons' partnership continued to play an active role in school plant design, by then in stylistic idioms that forwarded the cause of modernism.

Marsh, Smith and Powell

During the 1930s and early 1940s, Marsh, Smith and Powell designed numerous school commissions that garnered national attention. Their work brought together the latest ideas in functional site plans and child-centered buildings and classrooms, with the all-important indoor-outdoor spaces and connections. The same issue of *Architectural Record* featuring Lescaze's 1936 call to American architects used a Marsh, Smith and Powell school, Roosevelt Elementary School in Santa Monica, to illustrate the new trends.

Figure 89. Manual Arts High School, Parkinson & Parkinson, circa 1935. Source: LAUSD.

The firm, consisting of Norman Foote Marsh, David D. Smith, and Herbert James Powell, was also featured in a 1938 issue of *Architect and Engineer* in order to illustrate the "progress" made in American school design during the decade: "The architects of California can well take pride in that which has been accomplished during the last twenty-five years. Their school buildings are beautiful—they are practical, they are utilitarian, and they are economical. To the credit of the architectural profession, the architecture of educational buildings has kept abreast with the progress of education."[79]

Los Angeles City School District's The Progressive Elementary School: A Handbook

Southern California's version of the open-air, functional school was also brought to a national audience in 1938's *The Progressive Elementary School: A Handbook for Principals, Teachers and Parents*. The guidebook was written by Robert Hill Lane, the assistant superintendent of schools in Los Angeles and vice president of the Progressive Education Association. Published by Houghton Mifflin Company and prepared in conjunction with the Los Angeles City School District and State Department of Education, Lane's handbook explored the region's array of modern, functional, open-air school plants.

The handbook drew on the wealth of post–Long Beach earthquake examples with numerous illustrations and plates. It also described the philosophical underpinnings of the movement: the desire to create more child-friendly, inviting schools and classrooms. The handbook was one of many primers and guides on modern schools, but *The Progressive Elementary School* brought Los Angeles school plant design to a national audience.

The trend continued away from the institutional, monumental school block and toward more approachable, flexible facilities and plants. A few years before the end of World War II, the movement had footholds throughout the United States, just in time to decisively shape the character of schools designed during the postwar building boom. As one commentator noted in 1942,

> Here and there throughout the country there appear signs of another basic change in school architecture. It is primarily a movement away from the monumentalism of the past four decades. People are not using their school buildings to sell their communities. The school building is being developed as a more intimate and better integrated element of the community, a place closely association with child and adult living.[80]

The era of reform in progressive educational methods and school plants had thus come of age by the end of the Great Depression and just prior to 1945. Many prototypes and proposals emerged throughout the 1930s, with many examples from Southern California. By the time the war ended and construction began in earnest, these pre-1945 examples suggested the direction and the future shape of the modern, functional American school plant.

LOS ANGELES CITY SCHOOL DISTRICTS | CONTEXT AND DEVELOPMENTS

Long Beach Earthquake and the Field Act

The March 1933 Long Beach earthquake was one of the decade's most significant events for the region's built environment. The 6.5-magnitude earthquake caused significant damage and losses; in Long Beach, more than two-thirds of the city's schools were in need of demolition and reconstruction.[81] In Los Angeles, 40 unreinforced masonry school buildings were destroyed.[82] In addition, after a survey of Los Angeles schools within 10 days of the earthquake, all damaged or "precariously placed" chimneys, parapets, fire walls, and ornamentation were removed. Fortunately, the earthquake took place when school was not in session.

The Long Beach earthquake posed a disaster for the district but also an opportunity for the region's architects. While change and reform in school plant design were already underway, the Long Beach earthquake and the mini–school construction boom it triggered provided ample opportunities to test new ideas about school architecture and campus planning in Southern California.

These changes also affected the state overall. One month following the earthquake, through the efforts of California Assembly member Charles Field, the State of California adopted the Field Act. Similar legislation had already been passed following the 1925 earthquake in the City of Santa Barbara. With this, the state had adopted building codes tailored to upgrading seismic stability. In 1927, the City of Los Angeles revised its own City Building Ordinance and adopted additional requirements for schoolhouse construction. All new construction after 1927 adopted the updated building codes, which included requirements for fire-resistant corridors, stairs, and exterior walls and for reinforced concrete beams within floors and roofs. By the time the 1933 earthquake struck, these post-1927 schools indeed proved more resilient.

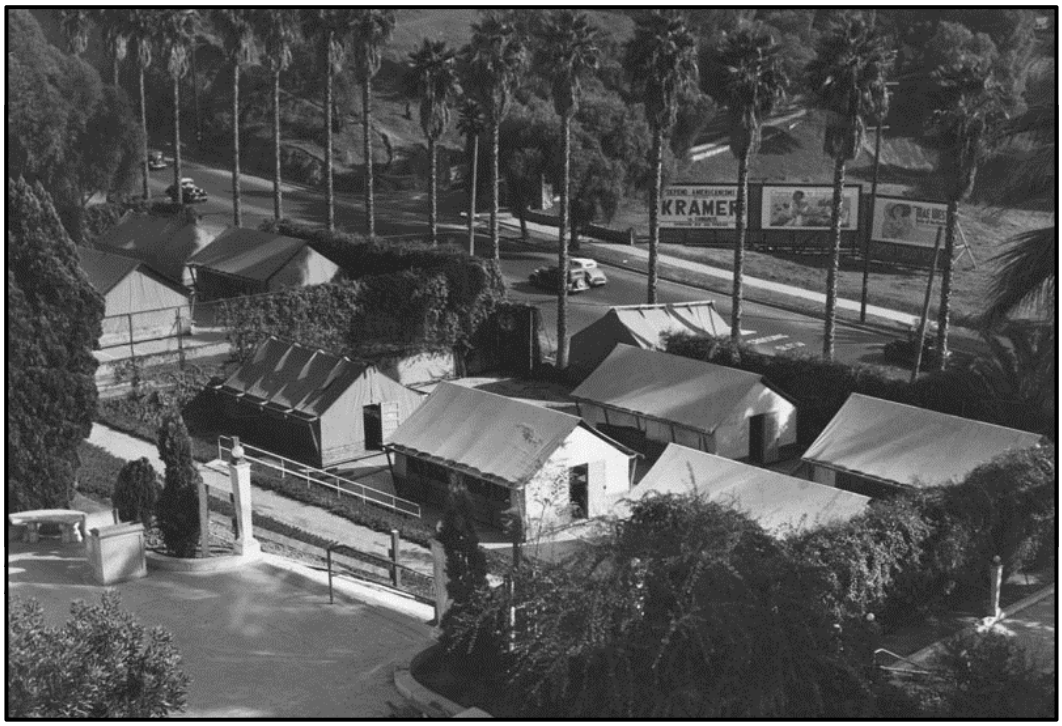

Figure 91. October 1934, Lincoln High Tent Village, awaiting reconstruction of classrooms. Source: LAPL Photo Collection.

Through the Field Act, the lessons learned in the Long Beach earthquake were used to further strengthen school building codes. The law directed the State Division of Architecture to design and enforce regulations to ensure earthquake-resistant buildings. State oversight and implementation of building codes/construction inspections were also established. Additionally, the City of Los Angeles Board of Education again revisited its own building codes. Post-1933 elementary school buildings were not to exceed one story in height, and high school buildings were limited to two stories (this would change over time, given the tremendous demand for classroom space in the postwar period and relative scarcity and expense of large lots). New buildings incorporated the latest construction techniques and prominently showcased the use of modern materials such as steel and reinforced concrete. On sites where soil load-bearing properties were found to be too low for steel and concrete, demolished schools were replaced with relatively earthquake-resistant wood-frame buildings. In cases where damaged buildings were rehabilitated, methods included installing reinforcing steel columns, beams, and diagonal bracing, exterior refacing with reinforced gunite and installation of reinforced concrete walls.

Some of the requirements of the Field Act were well aligned with the goals of progressive architects for more child-scaled, one-story schools. In a 1942 article on modern trends in school architecture, one commentator observed the overlapping influences: "Much emphasis has been given to the open plan in California. It is possible that this development has not grown so much from changing educational practice as it has from structural needs."[83] The author's insight had come from an *Architectural Record* article on a new

"open plan" school in El Monte, California. As *Architectural Record* pointed out, however, "'Two factors determined the choice of open plan, with departments housed in separate structures: the local soil-bearing value was very low; the buildings had to be designed to resist earthquake stresses.'"[84] In this way, the new requirements were compatible with the trend of the times toward one-story, open-plan buildings and campuses.

PWA Funding and the Post–Long Beach Earthquake Building Boom for Schools

Following the earthquake, the district planned for phased reconstruction. Available at the time were a total of $5.3 million in unsold bonds. The PWA purchased the bonds and granted additional matching funds for school reconstruction efforts. A total of $12.1 million was ultimately raised for the 1933 to 1935 reconstruction program. Approximately $250,000 funded the construction of temporary classroom housing, in order to minimize the interruption of the school year. An estimated 879 tents and 139 bungalows were initially erected to house the district's enrollment of 300,000 students.

As the school reconstruction program progressed, final steps included reinforcing or replacing 132 unreinforced masonry buildings, strengthening 275 buildings constructed since 1927, replacing 51 wood-frame buildings, and eliminating all temporary classroom housing. By 1937, over $34 million had been spent on post-earthquake school construction, repairs, retrofitting, and rehabilitation. The advent of World War II put substantial investments in schools on hold (after war's end, a $75 million bond issue kick-started these efforts).

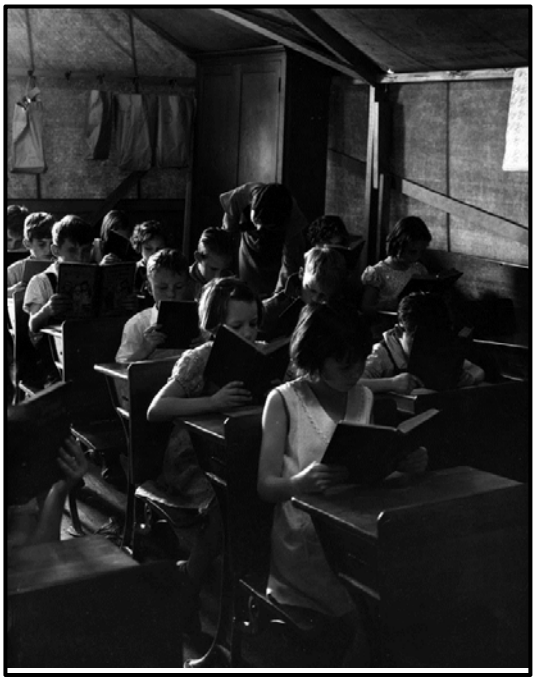

Figure 92. Children attending school in tents, one year following the Long Beach earthquake, March 1934. Source: LAPL Photo Collection.

As reconstruction began, Los Angeles City school districts intended to build new seismically sound buildings but also facilities with regionally inflected styles. As the *Los Angeles Times* reported in 1934, new and repaired buildings would be designed for "absolute safety with simplicity and beauty of architecture in harmony with the atmosphere and traditions of Southern California."[85] Many designs were executed by the district's architectural department, under the direction of Alfred Nibecker, but bids were also issued to outside architects, with the intention of awarding the work to a wide field of architects. In addition, new buildings were to be explicitly Southern Californian in design but "free of needless ornamentation."[86] This represented a move away from 1920s period-

Figure 93. Reseda Elementary School, 1936. The spare Mission Revival style was in keeping with the post-Long Beach earthquake trend to design in the "traditional Southern Californian" mode. This school is extant and located on Wyandotte Street, Reseda, San Fernando Valley. Source: LAUSD.

Figure 94. South Gate Middle School, 1941. A streamlined mix of Moderne, classical and modern elements. This school is extant and located on Firestone Boulevard, South Gate. Source: LAUSD.

revival styles but also a nod to earthquake safety, since applied ornament often failed and fell to the ground during earthquakes.

Early Experiments with the Finger-Plan School

Other school plants began exploring the new currents in modern, function-driven design. Henry L. Gogerty and C. E. Noerenberg's Susan Miller Dorsey High School is one such example. While the 1937 design drew inspiration from the PWA Moderne, the classrooms, patio spaces, and radial site plan, with classrooms extending outward like spokes of a wheel, were innovative for the time. With this site plan, the architects created an early form of condensed finger-plan school, which made use of a smaller site but provided the ample air, cross-lighting, and outdoor access possible with one-story finger-like classrooms. A circular outdoor corridor, sheltered beneath wide overhanging eaves with thin post supports, acted as the outdoor hallway for the campus, providing circulation to all classrooms and the main entrance. Adopting the language of functionalist reform, *Southwest Builder and Contractor* praised how the designs "architecturally and structurally express in functional form the outer envelope of a process of public education."[87]

Figure 95. Susan Miller Dorsey High School, 1937, Gogerty and Noerenberg, mid-city Los Angeles. Adopting the language of formalist reform, Southwest Builder and Contractor *praised how the design expressed "in functional form the outer envelope of a process of public education." Source: LAUSD.*

Great Depression and World War II: Curriculum Shifts

Just as the Long Beach earthquake struck in 1933, the Great Depression hit its nadir, and within the decade, the advent of World War II brought another round of readjustment. This period brought many changes to the operations and curricula of Los Angeles's public schools. Overall the decade was characterized by experimentation and liberalization of the curricula, in particular for secondary students. The general trend moved away from college preparatory studies and toward a more generalized program. Courses and new areas of emphasis came to reflect the realities of the era and the individual needs of students. A few examples include the expansion of social studies courses to consider contemporary issues and problems and a shift in the sciences toward more applied topics, aimed at the consumer rather than the future researcher.[88]

Through this era, the notion of the public school as an important gathering place for the community took a new turn. Schools became the focal point for a number of initiatives aimed at mitigating the social costs of the Great Depression, and later at supporting the troops during World War II.

By 1935, two federal programs had been launched that ultimately had a significant presence in Los Angeles public schools: the Emergency Education Program and the National Young Administration. Established in 1933, the Emergency Education Program provided federal

Figure 97. Lincoln High School War Bond Drive, 1945. Source: LAPL Photo Collection.

Figure 98. The women of Frank Wiggins Trade School, 1943. Source: LAPL Photo Collection.

funding to hire unemployed teachers to provide instruction to adults. With this, teachers were again gainfully employed and adults were able to further their training and education. By 1934, Los Angeles public schools provided approximately 200 such classes at 52 different campuses.[89]

In 1935, Congress authorized the National Youth Administration (NYA) program, aimed at providing jobs to teenagers and young adults in order to help them remain in school. The program was open to those aged 16 to 25, who earned no more than $6 a month. Through the NYA, Los Angeles public schools provided employment to thousands of students. After World War II began, this program continued but shifted its focus to defense-related classes.

Los Angeles Public Schools and World War II

World War II brought another round of adjustments to an educational system already reeling from the Great Depression. The focus on every front of American life for defense-related support brought major shifts. New classes for secondary students included defense-related training and specialized programs in aircraft recognition and aviation mechanics. At the city's vocational schools, applied skills were emphasized. The Frank Wiggins Trade School began teaching auto mechanics to female students, since the "war has taken away many a guy with the monkey wrench, and so today industrial schools are opening new courses for

women auto mechanics to fill the gap."[90] Coursework during the war and immediately after reflected the sociopolitical background of the time, with school districts offering programs in democratic systems of government, the functions of the United Nations, and, for a short time, "moral and spiritual values."[91] Geography courses took on a more international view, exposing students to a wider array of countries around the world.

The war also impacted activities in the city's elementary schools, where students were given opportunities to participate in a variety of war-related drives and programs. By 1942, Los Angeles City school districts had created nearly 30 different ways for students to support the war effort. The goal was organizing "every school so that each pupil and teacher had a part in supporting the war program" and inspiring "each child to be so patriotic that he would, of his own volition, carry on a program which would help the war effort."[92]

Two federal programs brought significant changes to the operations and curricula of Los Angeles public schools. The first program was the National Defense Training (NDT) program, which provided $15 million to American schools, $400,000 of which went to Los Angeles, for vocational and war-related training programs. Congress authorized the program in 1940 (before the U.S. entry into the war); by September 1940, the Los Angeles Board of Education had launched programs in 13 high schools and 10 evening high schools. Training programs included welding and shipbuilding, mechanics, and aircraft production and maintenance. The program continued to grow, and by 1942, Los Angeles City public schools housed the largest NDT program in the United States.[93] In August 1942, the NDT program because the War Production Training program.

In 1942, following the U.S. entry into the war, Congress established the Rural War Production Training program. A branch was established in Los Angeles, with classes targeted to working teenagers and adults attending evening high schools. Referred to as the Out-of-School Youth and Adults program, this initiative was more geared toward food production than industrial production (as with the NDT program). Canneries were established in schools throughout the district as a result of the program, which was renamed "Food Production War Training" in 1943. After the war, though federal funding of the project ended, the Los Angeles Board of Education continued the program, and community canning projects remained in place at a number of area high schools.

D. EDUCATING THE BABY BOOM: POSTWAR EXPANSION & THE FUNCTIONAL, MODERN SCHOOL, 1945 TO 1969

"Above all the school must be childlike.... It must be a place for living, a place for use, good hard use, for it is to be successively the home for a procession of thousands of children through the years. It must be warm, personal and intimate [so] that it shall be to each of these thousands 'My school.'"
—An American educator, writing to his architect, *Architectural Forum*, 1952[94]

NATIONAL CONTEXT | DEVELOPMENTS

With the end of World War II, the United States turned its attention to the long-awaited postwar—and post–Great Depression—expansion. The magnitude of the construction and population boom that followed, and its effect on the built environment, have been well documented. A wealth of literature has been devoted to the era's severe housing crisis, for example, and the array of initiatives launched to address it.

Less widely explored in the literature, but equally pressing at the time, was a dire classroom shortage. In 1949–1950, enrollment at U.S. elementary and secondary schools stood at 25.1 million. In one decade, this number expanded by nearly 50 percent to approximately 36 million; by 1971, it reached 46 million.[95] In 1955, in the midst of this boom, "editors at the *Architectural Forum* worried, 'every 15 minutes enough babies are born to fill another classroom and we are already 250,000 classrooms behind.' The rising population of young American children made school building, together with housing, the most widely discussed architectural challenge after World War II."[96]

Perhaps in no other state of the union was this growth felt more acutely than in California. The booming birth rate was accompanied by a wave of in-migration, as new settlers were drawn by established employment centers in, among other things, the aerospace industry, which had shifted operations to peacetime production. In Southern California, one region with a particularly strong pull in this regard was the San Fernando Valley. The postwar construction boom transformed miles of the San Fernando Valley's agricultural lands into new residential communities, and the population—and demands on schools—expanded accordingly.

School districts around the country struggled to keep up with unprecedented demand and overcrowded classrooms. Adding to the challenges facing school districts was the need not only for new schools, in particular in emerging suburban communities, but also the need to repair and maintain aging school plants, facilities, and equipment.

1930s Reform Comes of Age: The Modern, Child-Centered School

In this era, the functional, child-centered school plant that emerged in experimental form in the late 1930s became the norm. Newspapers, magazines, and trade journals in a variety of fields—including architecture, engineering, building trades, education, and school design—began forwarding proposals for the ideal modern school. Organizations devoted to the topic also helped standardize and disseminate these ideas; these included the American Institute of Architects Committee on School Buildings, the National Council on Schoolhouse Construction, the American Association of School Administrators, and the Council of Educational Facilities Planners. Journals and guidebooks proliferated with the latest ideas in school plant design, infrastructure and systems, and, above all, how to meet the demand in the most economical fashion possible. Within the architectural profession, a new subgroup of architects who specialized in school design also started to emerge.

Modernism—whether regionally inflected, wood post-and-beam or the machine-age International Style—became the idiom of choice for expressing the new ideas, for its relative economy, informality, accessibility, and, increasingly, "democratic" spirit:

> All the architecture shall be a setting for childlife. Everywhere children and what they can do shall be the adornment of the structure. The building itself shall be the place of joy in living. But I must warn you. It must be a place which permits the joy in the small things of life, and in democratic living. These two things we must safeguard in children's lives.[97]

While some school plants adopted the period styles popular at the time—including a postwar return to American Colonial Revival—the trend by not only modern architects but also educators was to move beyond historicist styles: "The building must not be too beautiful," wrote one commentator, "lest it be a place for children to keep and not one for them to use. Its materials must be those not easily marred, and permitting some abuse. The

Figure 105. Smith, Powell & Morgridge, Thomas Jefferson Elementary School, 1954. Source: J. Paul Getty Trust, Getty Research Institute, Julius Shulman Archives.

finish and settings must form harmonious background with honest child effort and creation."[98]

While regional variations existed, this was a national project. The extent to which school districts throughout the United States adopted similar approaches and strategies to the modern school plant was noteworthy. Since the early twentieth century and the days of the Progressive Education Movement, national standardization was a key element of reform. But the avenues available to architects, builders, and schools in this regard proliferated in the postwar era.

The National Council on Schoolhouse Construction, for example, addressed the topic in its annual guidebook, *Guide for Planning School Plants*. Written for school facilities managers, planners, and architects, the 1946 version illustrates the extent to which ideas considered experimental just a few years before had become best practices for the nation. The emphasis remained designing schools around their function—serving and educating children. With the psychological well-being of the student the prime consideration, numerous studies were devoted to optimal interior conditions and controls, such as studies in proper lighting, color schemes, and surface reflectivity to "increase morale and to decrease fatigue."[99]

Educational Facilities Laboratories (EFL)

The need for schools remained dire through the 1950s. In 1953, the American Institute of Architects established its Committee on School Buildings to address the issue. In 1956, the committee became the Educational Facilities Laboratories (EFL), a nonprofit funded by the Ford Foundation's Fund for the Advancement of Learning. The EFL "brought together educators, architects, manufacturers, and government officials" to "encourage new ideas about both curriculum and architecture."[100] The EFL conducted research, sponsored conferences, and held grant competitions.

With the rate of school construction continuing apace, EFL officials visited Southern California often. In 1962, the EFL sponsored a tour of one of the nations' early open-plan schools in West Covina, California. Attending the tour were Dr. James D. MacConnell, director of the school planning laboratory at Stanford University; Dr. Paul Salmon, superintendent, Covina Valley District; and Dr. Harold B. Gores, president of EFL in New York. In 1965, the EFL conferred an award on Covina High School as one of three outstanding Californian examples of "schools without walls" (the open-plan school, described in more detail below).[101]

In 1964, the EFL sponsored an airplane tour of the United States for 60 educators, including two from Orange County. The EFL flyover tour reflects two noteworthy points about this era in school design: (1) many innovations were best revealed from the air, by looking at the campus design and plan, building siting and configuration; and (2) ideas about how to create the best possible modern school were developed in tandem and shared among architects, builders, researchers, and school officials throughout the United States.[102] Between 1958 and 1976, the EFL invested over $25 million in the rethinking and designing modern American educational facilities.[103]

By the early 1960s, a shortage of teachers, as well as ever-evolving ideas about childhood development and education, prompted a renewed wave of reform. At its heart was an updated version of the Progressive Education Movement: the idea was that schools—both in terms of facility design and teaching methods—were not adequately harnessing a child's natural curiosity and creativity. There was a renewed sense that classrooms should nurture and capitalize on these qualities and adapt to the individual needs and pace of each student.

The national embrace of team teaching (an idea further promoted because of a shortage of qualified teachers) was one result of this movement. As the name implies, team teaching established a system whereby teachers shared pupils and class spaces, and classroom sizes varied throughout the day, depending on the wishes of the teachers. A few dozen students might gather to watch a movie, then break into smaller groups to work on projects. The classroom would be a dynamic rather than static place, with mixed grade levels, multimedia educational methods, and hands-on learning.

This push for more creative, flexible curricula and teaching methods flourished in Southern Californian schools. By 1968, reformed programs had been launched in 18 Southern Californian elementary schools, in conjunction with the League of Cooperating Schools. As in early eras, methods that appeared "traditional" were de-emphasized and a more experimental classroom environment was proposed. The coordinator of the program, Robert E. Keuscher, invoked many of the same ideas shaping curricular reform throughout the twentieth century, with a distinctively 1960's spin:

> Labels are disappearing, there are fewer graded classes. Schedules are more flexible. More and more, curriculum is not worked out in advance; the kids work it out as they go along, and it's more advanced and more scholarly. The teacher is more of a guide than an oracle. The emphasis is shifting from the group to the individual; there is more emphasis on query and discovery.[104]

Of the Southern Californian schools making this transition, Keuscher said, "We're helping these 18 become creative schools, but it's a slow, painful process. Our biggest problem is to make teachers and principals comfortable with change. … But it has been great to emancipate the creative teacher."

Throughout this era, the debate on how to shape a curriculum that best served children, and how to keep up with ever-expanding enrollment figures, continued to evolve. Yet the basic ideas seen in the early twentieth century remained at the heart of educational reform at midcentury. The evolving experiments in curricula and school plant types grew out of the same wish to eliminate institutionalism and to fashion a child-centered curriculum and school plant. The variety of building plans and campuses that grew out of midcentury reform reflected the postwar boom of construction and population, the robust network of publications and organizations disseminating the ideas nationally, and evolving philosophies about childhood development and education.

EFFECTS ON SCHOOL BUILDINGS AND CAMPUSES

The stylistic vocabulary of choice for American schools became modern—antihistoricist, decentralized, with function instead of style the driving concern. Of course, modernism did not take hold in earnest for residential design (to the dismay of many architects at the time). But for schools, by 1950, "the battle between 'contemporary' and 'traditional' was won. The public not only began to accept 'modern,' but also demanded it. … This new movement … brought together educators as well as architects, and together they are forwarding the cause of architecture for children."[105]

Although this era brought a major stylistic shift, from the architects' perspective, designing in a modern "style" was not the main concern. Progressive architects at midcentury often sounded a tone of idealism about the social value of their work. As architect William Wayne Caudill explained about school design, "There is no 'modern' style as such. Each new building ideally is the product of specific solutions to individual problems peculiar to that building's particular environs, site, function, budget, and designer. If two new schools are similar in appearance, they are … only because they were designed to perform similar specific functions in similar environments."[106]

This was especially true for architects trained and already practicing in the pre-1945 era. William Wayne Caudill was among them; the Texas architect graduated from MIT in 1939 and, by 1941, had already authored a pioneering study on modern school design, *Space for Teaching*. Throughout the 1940s and into the 1960s, Caudill and his firm specialized in functional, modern classrooms and campuses.

Figure 109. Balanced cross-lighting is achieved through full-length windows on the north elevation and clerestories on the south. Franklin & Kump, Acalanes Union High School. Source: Built in USA, 1944.

By 1969, Caudill had become an international authority on school design, and his firm, Caudill, Rowlett & Scott, had designed educational facilities in 28 states. Caudill's classic finger-plan schools in Blackwell, Oklahoma, designed in the late 1940s and early 1950s, epitomized the school planning ideals of the time. In 2009, all four schools--Huston, Northside, Parkside, and Washington Elementary—were listed on the National Register for their exemplification of postwar ideals of modern American school design.

Whether a postwar school exhibited a modern or mildly historicist design, they likely shared the same basic design principles. Postwar schools were designed to feel decentralized, nonhierarchical, approachable, informal, and child-centered (indeed, domestic-scaled for elementary schools, with lower ceilings making the class feel more like a living room). The preferred massing was one story, with an axial wing of classrooms usually one room deep, to provide cross-lighting, ventilation, and easy access to the outdoors.

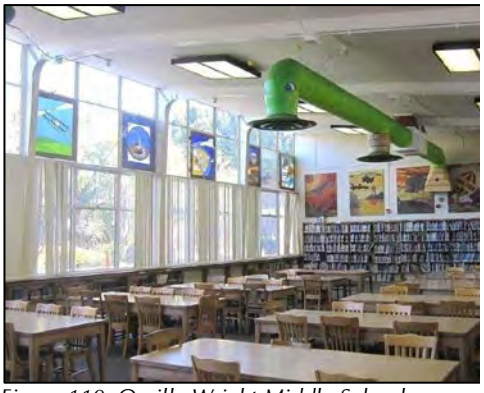

Figure 110. Orville Wright Middle School, library roof slopes upward on north elevation to allow for maximum indirect lighting. Source: LAUSD Orville Wright Middle School, Pre-Planning Survey, 2011.

Postwar schools continued to emphasize and experiment with the limits of indoor-outdoor integration. By the postwar period, one feature that was still experimental in the 1930s was now essential: canopied outdoor corridors. Supports remained simple posts or pilotis, either in steel or wood post-and-beam. It was a feature used in schools throughout the United States. Outdoor corridors lined classroom wings, providing sheltered circulation throughout the campus as well as outdoor gathering spaces.

During this period, size and orientation of windows took cues from the environment: a building with north-south exposure, for example, might feature large-panel, floor-to-ceiling glazing on the north elevation, with bands of clerestory casement windows on south elevations modulating or softening illumination. Experiments in roof configuration and design also tackled the issue not only of lighting but acoustics.

Figure 115. Classroom and patio are one in Neutra's Kester Avenue Elementary School (1951), extant, Sherman Oaks, San Fernando Valley. Source: Getty Research Institute, Shulman Archives.

When necessary, massing might climb to two (or rarely, three) stories, if real estate was scarce and demand was high. But this allowance was more commonly made for junior and high schools. Roofs were flat, sloped, or occasionally gabled, with simple, exposed construction systems of steel or concrete framing with large-pane in-fill windows. Wide overhanging eaves with simple porch or piloti supports were common for connecting corridors. In terms of materials, the treatment and finishing were simple and unpretentious.

In the postwar period, architects economized through the use of new prefabricated materials, such as plywood, glass, and steel, as well as modular design and coordination, a 1930's movement that took off in the postwar era following the 1945 adoption of the 4-foot module as the American Standard Measurement.[107] Modular design and construction allowed for easy expansion as school enrollment grew and was a common construction technique in Southern Californian schools. (Two early all-steel-frame schools in Los Angeles were the 1937 Emerson Junior High, by Richard Neutra, and the 1959 Justice Street Elementary School in Canoga Park; stylistically unpretentious, the school was promoted as durable, safe, and easily expandable, a concern that remained pressing at the end of the 1950s.)

Modular site planning and design also lent itself particularly well to creating the indoor-outdoor connections now considered essential. As with the residential architecture of the era, school design relied on generous expanses of windows and outdoor access to patios or courtyards to provide students with recreational areas and outdoor classrooms. Throughout the United States, the importance of indoor-outdoor living for both residential and educational architecture remained a central concern. In this respect, California schools continued to garner national attention. In its 1949 series on postwar American schools, for example, *Architectural Forum* commented that "possibly because California's balmy climate ventilates educators' minds as well as their houses, California schools have been less tradition-bound than most. As one of the fastest growing states in the union, California has had plenty of chance to experiment in school design."[108]

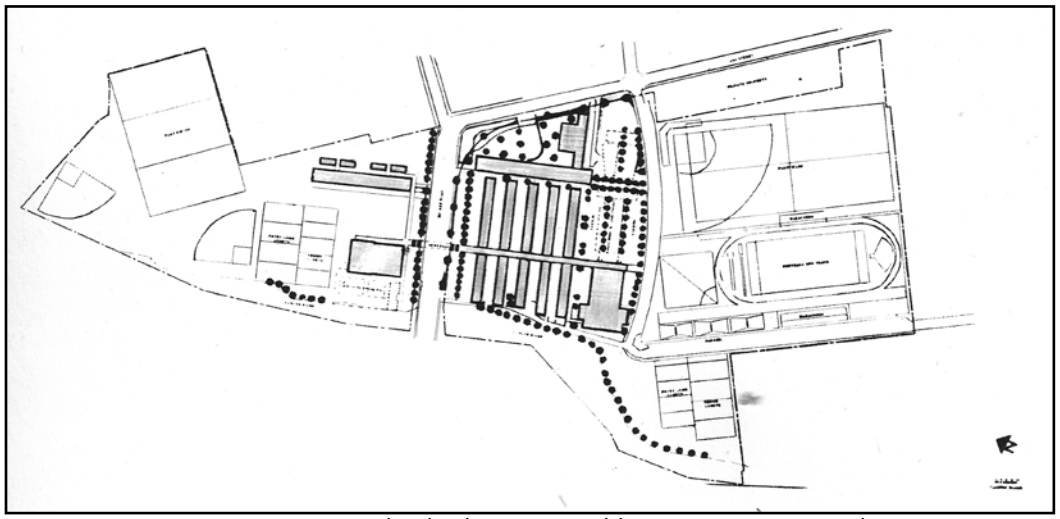

Figure 116. Ernst J. Kump, San Jose High School, San Jose, California, 1952. Source: Built in USA, 1952.

By the 1950s, school design had entered "a new age of innovation," as the decade brought "a proliferation of standardized plans and facades."[109] In California and elsewhere, three main plan types emerged during this period: the finger-plan school, the cluster-plan school, and the open-plan school. As the trends came and went, these plan typologies morphed, hybridized, and changed. But they shared basic design principles, and most reflected the tenets of midcentury modern design.

The 1940s and the Decade of the Finger-Plan School

The plan type that best captured the design principals of the immediate postwar years was the finger-plan school, which was launched in the late 1930s in Franklin & Kump's Acalanes Union High School and the Saarinen's Crow Island Elementary School. According to *Architectural Forum*, this plan type, dubbed the "western finger plan," became the most influential building typology for schools in the 1940s. The finger-plan school resembled

> a tree plan, based on a trunk corridor with side branches. It rests on radical standardization of classrooms; on absolute insistence that all classrooms share the best (north) orientation to sun and air; daylight for all of them from the open-corridor side as well as the main window side. This plan is not only flexible … but extensible indefinitely outward like a tree, by growing at branch-ends and by sprouting new branches.[110]

To illustrate the advantages of the plan in 1949, *Architectural Forum* chose the 1939/1940 Acalanes Union High School, which it described as

> the first large scale school which could serve as a complete demonstration of principles which amounted to a schoolhouse revolution—the revolution of the thirties. Since then, the Acalanes type of school, with its wide ranging, one-story classrooms arranged according to the "finger" plan, has swept the West Coast, is sweeping rapidly across the Midwest on its way to the East Coast.[111]

Figure 119. Exterior of a finger-plan school: G. Russell Wilkerson Elementary School, 1950, El Monte. Source: Getty Research Institute, Shulman Archives.

Acalanes had been published nationally, on multiple occasions, prior to 1945, but it was in the postwar period that the "schoolhouse revolution" it started took off in earnest. In the immediate postwar period, numerous examples could be found on the West Coast. Even though the plan type spread through the United States, the Californian roots and flavor of Acalanes Union High School were often highlighted.

In 1958, a self-described "primer" on how to build a good modern public school described Acalanes High School's divided "rows of classrooms with open-ended corridors of greenery, to achieve good ventilation, sound isolation, and a remarkable California-like architectural comfort."[112]

Built in USA included another California finger-plan school in its 1952 edition, San Jose High School, also by Ernest J. Kump. In San Jose High School, Kump proposed a slightly more condensed finger-plan, with concrete-frame construction, generous expanses of windows set flush to the wall plane, and a sheltered corridor with unadorned post supports providing circulation and outdoor spaces.

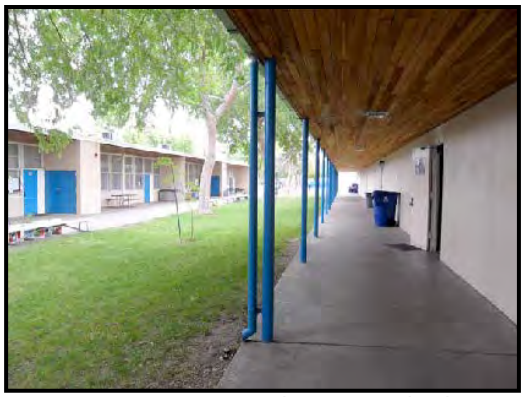
Figure 120. Huston Elementary School, Caudill, Rowlett & Scott, 1949, Blackwell, OK. Source: Getty Research Institute, Shulman Archives.

Figure 121. Huston Elementary School, Blackwell, OK. Source: Google Maps, 2013.

With many of the early experimental schools located in California, the issue arose of whether these prototypes would work in the rest of the country. In a 1943 article on modern American schools, Elizabeth Mock commented on this question: "Many people have the illusion that such schools are impractical. 'Fine for California,' they will say, 'but not for this climate. Too costly to build and heat."[113] However, Mock argued, modern materials and construction techniques were sound and economical enough to mitigate these problems. William Caudill appears to have agreed, as evidenced in his four classic finger-plan schools in Blackwell, Oklahoma (all now listed, as noted earlier, on the National Register of Historic Places).

As the popularity of the finger-plan school increased, its basic form changed to accommodate climate variations. Modifications on the plan included double-loaded hallways to provide the same level of indoor-outdoor connections, light, and ventilation, but with one less elevation exposed to the exterior. In the Midwest, the spread-out finger-plan became a compact trunk, with double-loaded corridors providing better insulation. Other plan innovations included a zigzag building plan, with an interior connecting walkway, in order to double-load corridors but also maximize window space for each classroom.

Two examples of more condensed finger-plan schools are seen in Richard Neutra's Kester Avenue Elementary School in Sherman Oaks and Robert Evans Alexander's Baldwin Hills Elementary School in Los Angeles, both from 1949 to 1951. Neutra designed the finger-plan of the Kester Avenue Elementary School around a compact central axis, with classroom wings alternating with landscaped patios. With its seamless connections between classrooms and outdoor play areas, the Kester Avenue facility displayed, in Esther



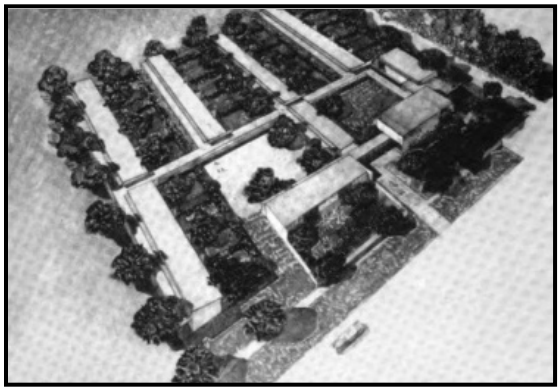


Figure 122. Kester Avenue Elementary School, Richard Neutra (1951), Sherman Oaks. Source: LAUSD Kester Avenue Elementary School Pre-Planning Survey, 2011.

McCoy's word, the "essentials of the open-air classroom ... restated in a more refined form."[114] Canopied passageways supported with light steel columns provided circulation and outdoor gathering areas.

Baldwin Hills Elementary School was constructed as part of the groundbreaking garden city of Baldwin Hills Village. Architect Robert Alexander arranged the school along a central corridor/axis, with parallel classroom wings extending from each side in lengths tailored to fit the site. Swaths of greenery divide the classroom wings, which are sheltered beneath wide overhanging eaves. The focal point of the entrance is a dramatic, cantilevered canopy, resting on a simple steel I-beam. The design otherwise is spare, unpretentious, and modern.

The 1950s and the Advent of the Cluster-Plan School

By the early 1950s, the popularity of the finger-plan school had begun to decline.[115] First, the design required large swaths of land to accommodate the extended site plan. Second, the plan increased cross-campus walk times and communication. In some scenarios, it also made more sense to build upward instead of outward. On hillside locations, where an expanded footprint meant doubling or tripling already expensive grading costs, the finger-plan school was not a viable option. In mass circulation and trade magazines of the day, though, the one-story scale was still preferred, in particular for elementary schools (the exception remained densely developed urban sites, where one could only expand upward).

The need for cost-effective school design and construction was an additional factor in the move away from the finger-plan. By the early 1950s, there were signs that the immediate postwar focus on carefully harnessing and controlling light—including orienting the building on a north-south axis to create the perfect blend of cross-lighting—was becoming too time-consuming. Not all sites would be large enough, and not all building programs well-funded enough, to justify having such an expenditure of design time devoted to fenestration alone. In 1952, *Architectural Record* observed that, in national school design,

> in more and more localities we can expect substantially less emphasis on daylighting. Natural light is so variable that it can seldom be relied on during the entire school day without considerable recourse to electric light. Control of daylight to prevent glare has been found costly and involved.[116]

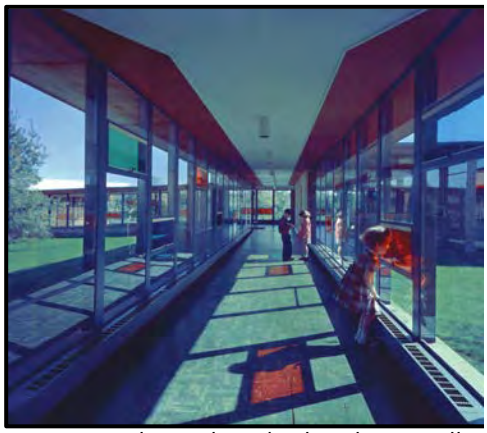

Figure 130. Cluster-plan school, Perkins & Will, Heathcote Elementary School, Scarsdale, New York, 1953. Source: Ogata, 2008.

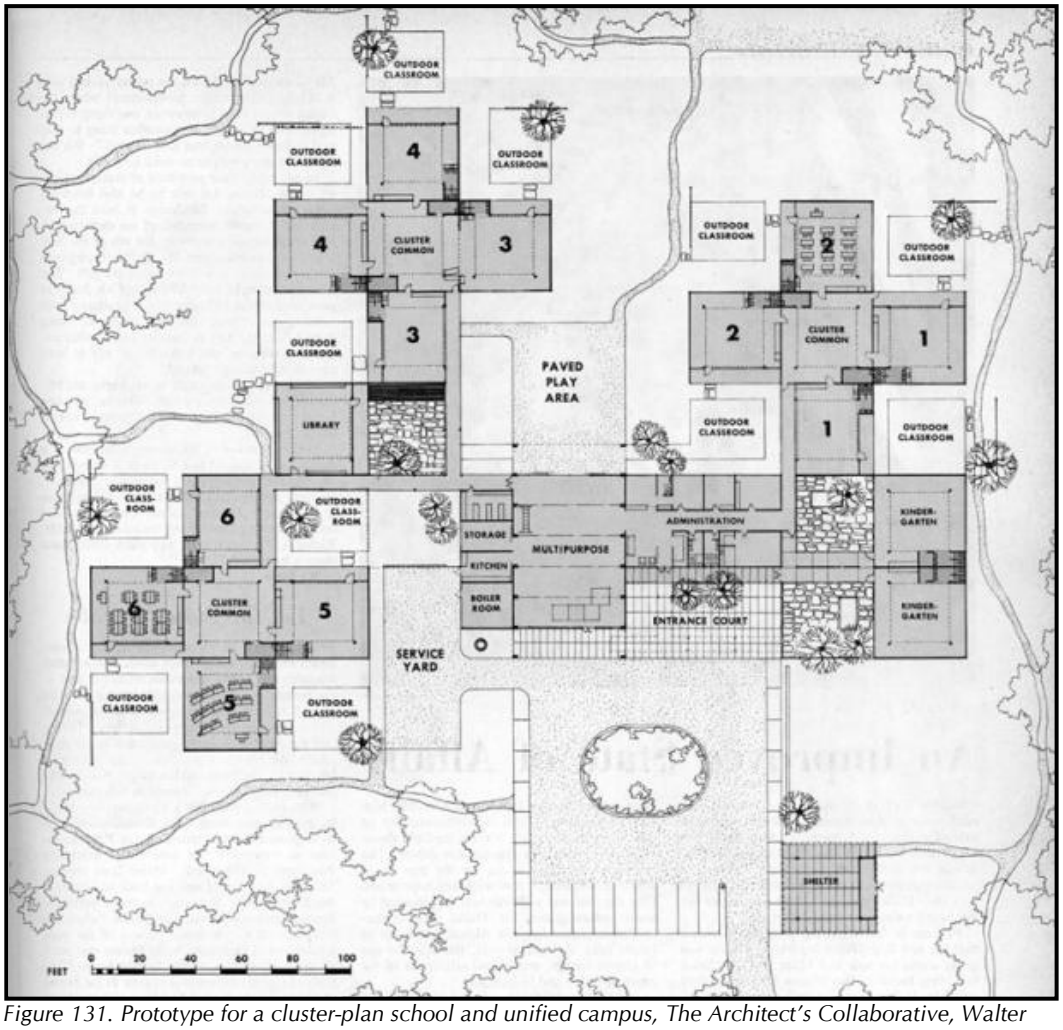
With high demand and restricted funding for new schools a constant issue, the possibility of a more compact campus plan became the subject of study, a few early prototypes, then a new trend, the cluster-plan school, by the early



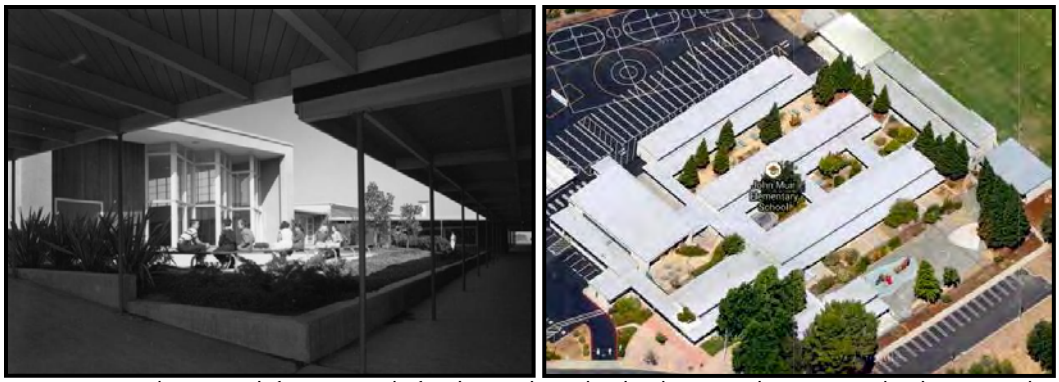


Figure 131. Prototype for a cluster-plan school and unified campus, The Architect's Collaborative, Walter Gropius, 1954. Source: Ogata, 2008.

1950s. The cluster-plan school offered a logical solution to these issues. It retained the low massing and indoor-outdoor access and views for all classrooms. But rather than extending wings along an axis, the plan called for grouping them as modular, standalone units around a shared central courtyard. Classrooms still had generous expanses of windows, but now views took in the courtyard and other classrooms, which provided a more communal, neighborhood-like setting. As architectural historian Amy Ogata observed, the plan type provided "both economy and a meaningful spatial experience. In organization and details, the prominent cluster schools of the early and mid-1950s reflected a new sensitivity to the child's perception."[117]

As with the finger-plan, the new typology was interpreted and designed in many different variations, but the basic ideas remained the same.

Even in California, with space to grow, the cluster-plan became the preferred typology in the 1950s. Finger-plan schools were still built—usually the condensed or modified typologies

Figures 132 and 133. On left: Courtyard of a cluster-plan school: John Muir Elementary School (1951), John Lyon Reid, Martinez, California (northern California). Source: Ogata, 2008. On right, aerial of John Lyon Reid, John Muir Elementary School. Source: Google Maps, 2013.

already emerging by the late 1940s. But by the early 1960s, the cluster-plan school had "almost universally replaced the finger plan concept."[118] In a five-year study of the state's school plants, the California Department of Education praised the cluster-plan for more efficient land utilization and for encouraging "cooperation between teachers by allowing them to share multiuse classrooms, resources center, and teacher preparation areas, all adjacent to their classrooms. … Better acoustical control and lighting is evident, and technology is enabling these comfort factors to be coordinated with flexible interiors."[119]

The advantages of this plan were many: more child-friendly in its scale and setting, especially for younger children; more communal, with more shared spaces; and easier to supervise. With this plan, what had been the corner of the room on the interior became the front row on the courtyard.

One early example in California was John Lyon Reid's 1951 John Muir Elementary School in Martinez, California, northeast of San Francisco. In his design, Reid employed a typical pavilion-like plan, with long one-story classrooms separated by patios and landscaping, accessed via sheltered walkways with wide eaves. The classroom wings are clustered around cross-wings, creating a courtyard setting. As with the Saarinens' Crow Island school, Reid's L-shaped classrooms created enclosed outdoor areas for outdoor play and recreation. In a demonstration of the nonhierarchical, informal campus, Reid also eliminated the formal auditorium and designed instead an all-purpose room, "for meetings, lunches, and play, that looked onto a central courtyard through large sharply angled windows."[120]

Within the Los Angeles City School District, Sumner Spaulding and John Rex's Orville Wright Middle School (originally Westchester High School) was another early example of a finger-plan and cluster-plan hybrid, this time for a high school campus. The school incorporated the best of midcentury modern design, by one of the region's renowned firms, with the newest design principles for school plants. Completed in stages between 1948 and 1952, Orville Wright Middle School was constructed for a growing residential community near one of Los Angeles's centers for the aerospace industry.

Figure 136. Westchester High School (now Orville Wright Middle School), Spaulding & Rex (1948-1952), west Los Angeles. Source: J. Getty Trust, Getty Research Institute, Shulman Archives.

In a spare, modernist design, Spaulding & Rex incorporated the same modular design, low massing, and easy indoor-outdoor connections typical of the era (and midcentury modernism in Southern California). Cross-lighting was provided through bands of clerestories and single-pane fixed and casement windows. A network of canopied corridors linked buildings and facilities throughout the campus. In a nod to the aerospace industry employing much of the adjacent community, the campus cafeteria featured a circular, space-age design.

The campus overall displays a decentralized but unified plan, zoned for automobile and pedestrian-only areas, with pavilion-like classrooms wings "clustered" around courtyards. In the "Curating the City" program for modern architecture, the Los Angeles Conservancy noted that Spaulding and Rex's Westchester High School took the basic tenets of the International Style and Southern Californian educational architecture and "turned them into a spectacular example of a Mid-Century Modern school. … This campus is a wonderfully intact and very vibrant testament to the power of good 'design for learning.'"[121]

Another LAUSD example of a hybrid finger- and cluster-plan school is the George K. Porter Middle High in Granada Hills. Built in 1959 and designed by Rowland H. Crawford, the campus displays a pavilion-like plan, with axial classroom wings connected by a central corridor. Swaths of landscaped patios divide the classrooms. Interrupting the axis, the focal point of the campus is a landscaped quad, with an expansive lawn ringed by trees creating a neighborhood, park-like setting.

Figure 140. George K. Porter Middle School (1958), Granada Hills, San Fernando Valley (extant). Source: Getty Research Institute, Julius Shulman Archives.

Typical of modern campus planning, and similar to Orville Wright Middle School, the site plan turns inward on itself. Automobile traffic and drop-off areas are located on the exterior, with extended canopied corridors providing access to the campus.

The George K. Porter Junior High also reflects how Los Angeles's still-expanding suburbs provided a testing ground for modern design and programming ideas school plants. The school is located in Granada Hills, also home of Joseph Eicher's celebrated midcentury modern tract of Balboa Highlands, now a Historic Preservation Overlay Zone in the City of Los Angeles. These buildings and so many others like them reflect how the suburbs continued to expand, especially throughout the San Fernando Valley, and how by the late 1950s midcentury modernism enjoyed wide acceptance among the public.

The 1960s and the Open-Plan School

Another wave of school plant reform in the early 1960s brought calls for more flexibility. To accommodate the new method of "team teaching," the focus became designing completely adaptable interiors, with movable walls and few built-ins, in a new typology known as the open-plan school.

In light of this new trend, the finger-plan of the 1940s—those "once-daring school plants with long corridors and classrooms located on one or both sides were now dismissed as hopelessly dull 'egg-crates.'"[122] Basic features like load-bearing interior walls came to be seen as too limiting. As the EFL wrote in a study, "'Old walls should not stifle new ideas. Identical boxes must not enforce the same program on all students and teachers; each is a unique individual. Fixed furnishings must not quash spontaneous inquiry.'"[123] The school capable of serving the needs of students, the EFL concluded, offered space to "accommodate groups of various sizes from 100 students down to one or two students studying by themselves" and "space allowing for the rapid shifting of group size or change in group's activity."[124]

Figure 141. Caudill, Rowlett, & Scott, Paul Klapper School, New York, 1966-1967. Source: Ogata, 2008.

EFL findings were well publicized and widely published, first finding audience in the nation's many education-related trade publications and into mass-market newspapers. Reporting on the findings of an EFL study, the *Los Angeles Times* wrote that "if you were to take the roof off most schools and look in, you would see a series of identical rooms, approximately 30x40 ft., strung along both sides of a corridor. This is the floor plan of an obsolete school."[125] This description, of course, fit the classic finger-plan school, and many cluster-plan schools, considered cutting-edge just one decade before.

Figure 142. Thurston School, Open Plan Model (1967), Flewelling & Mood. Source: Getty Research Institute, Julius Shulman Photography Archive.

What this meant in terms of school design was a less low-slung, spread-out campus; the buildings were more compact, with higher ceilings. The idea of cross-lighting and ventilation provided by the long rectangular classroom wing fell out of favor. They were no longer as essential, since, in the early 1960s, improved air-conditioning systems diminished the importance of cross-ventilation and less glazing was generally

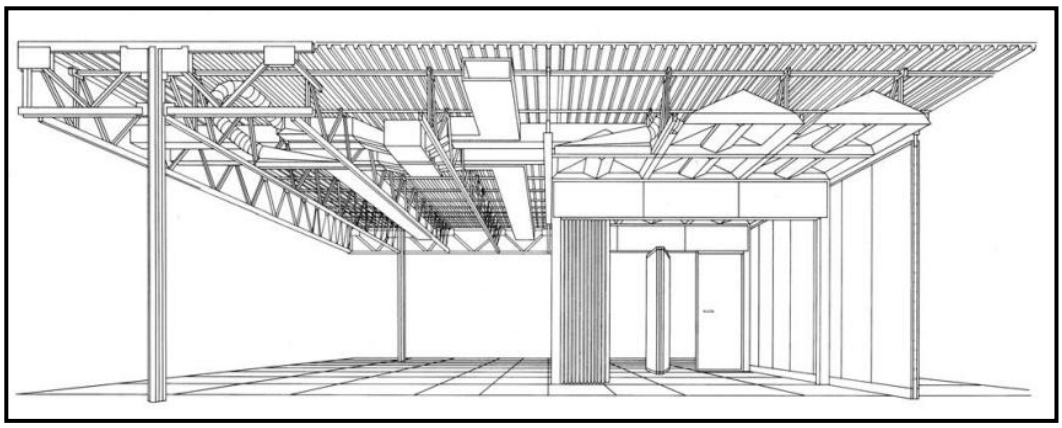

Figure 143. Standardized, demountable components for an open-school, School Construction Systems Development. Source: Ogata, 2008.

used. Since the open-plan school had to accommodate interior spaces separated by non-load-bearing walls, roof spans had to be long and high, with a steel structural system providing, essentially, a large high space into which the school's program could be designed. Massing increased, and corridors moved back inside.

Although the most obvious changes brought by the open-school plan were to school interiors, the shift was also discernible on the exterior. Some—but not all—open-plan schools adopted the circular form, with architect William Caudill arguing that the circular form best served team teaching, since the circular plan offered "continuous movement of children."[126]

Architects also experimented with hexagonal building shapes, either with self-enclosed campuses or smaller circular classrooms clustered around a common area or courtyards (in yet another variation bringing together two plan types). One of the "most adventurous examples" of the plan type, according to architectural historian Amy Ogata, was Caudill, Rowlett & Scott's Paul Klapper School in New York, constructed in 1966/1967.

School Construction Systems Development (SCSD)

In efforts to promote the open-plan school, the EFL awarded a substantial grant to develop "an economical, standardized building system" through its School Construction Systems Development (SCSD) program.[127] The program developed, standardized and manufactured modular components and structural systems for open-plan schools. The SCSD school components and infrastructure were standardized but aesthetically flexible, allowing for design and plan variations so that "architects were not limited in plan layout."[128] High roof spans of 60 to 70 feet provided the structural template into which the school's interior program could be designed.

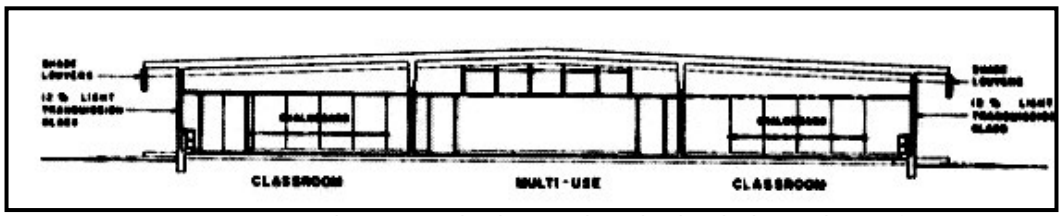

Figure 144. Section, Van Duzen Elementary School, open-plan school with cluster-plan configuration. Source: Gibson, 1965.

The SCSD system was promoted nationally. In 1962, the program "had the commitment of twelve California school districts to develop and build schools worth 25 million dollars."[129] Ultimately, 13 SCSD schools were constructed in California. The formation of the SCSD also grew out of the astronomical costs facing school districts and boards to keep up with demand; the goal was creating prototypes that offered economical, good design, reflecting the latest ideas in educational methods and school plant design. Modern school architects around the nation experimented with the new ideas.

Ultimately, in spite of high expectations, open-plan schools "faced problems of practicality and perception."[130] Problems related to acoustics plagued open schools, for example. The gap between theory and practice also became an issue, as the open-plan school did not in and of itself guarantee that teachers would adopt the creative, flexible team-teaching strategies that had prompted design reform in the first place. Much national debate and discussion about the open-plan school took place in the educational and architectural trade press. By the mid-1970s, the open-plan school had joined the finger-plan and cluster-core plan as experiments in school design that declining quickly in popularity.

As with the finger- and cluster-plans, there were many combinations of the main plan types. The Van Duzen Elementary School in Northern California, for example, represented one of first "cluster plan schools built in California with open planning."[131] Constructed in the early 1960s for a cooperative/team teaching program, the school consisted of three parallel classroom wings, open and flexible on the interior, but configured around an exterior courtyard, for the benefits of the clustered site plan.

Constructed in 1964, the Round Meadow Elementary School, in Hidden Hills, was another example of an open-plan school, this time in Southern California. Again, the cluster-plan idea played a role in the design: "This school is designed so that each building can work as a cluster-type 'little school.'"[132] At the center of each open-plan building was a multipurpose area, with a resource center and library. The buildings tended to be higher, with more wall space and fewer windows. The interior was made flexible through the use of folding walls, and a relative lack of windows was compensated for through a modern air-conditioning unit. As with the earlier postwar typologies, the open-plan type accommodated a variety of stylistic variations.

LOS ANGELES CITY SCHOOL DISTRICTS | CONTEXT & DEVELOPMENTS

The Building Program

In the postwar period, the order of the day for Los Angeles City school districts was keeping up with demand. Overseeing the first decade of postwar expansion was Alfred Nibecker, who had served as chief architect for the architectural department of the district since the 1920s. As before, Nibecker oversaw design and construction of schools, with a variety of commissions still shared between area architects, in particular those who had begun to specialize in school design, and the in-house team of the district. In 1955, Nibecker was made an honorary member of the Structural Engineers Association of Southern California, the association's highest award. That same year, he retired. Following his retirement, the board appointed Ernst Raymond C. Billerbeck as district architect.[133]

As school construction expanded in the suburbs, however, enrollment figures at several downtown schools were in sharp decline, resulting in the closing of a number of campuses in the postwar period (among them Central Junior High, founded in 1911 and closed in 1946; and Lafayette Junior High, founded in 1911 and closed in 1955). Between 1946 and 1953, the enrollment of Lafayette Junior High dropped by one-half, falling from nearly 1,400 in 1946 to 700 in 1953/1954, reflecting the population shift from the city to the suburbs.[134]

During this period, standardized construction techniques and components, with variations reflecting differences in site conditions and demand, allowed the district to expedite construction. Standardization meant that many campuses throughout the district, in particular schools constructed during the 1950s, display identical or similar elements and features. Common modular components (for elementary, middle, and senior high schools) included classroom wings that are one-room deep, one story in height, with a finger-link rectangular plan. These buildings are often capped with a slightly sloped shed roof. Along one side (intended for southern exposure), clerestories span the building below the roof line. Shade is provided through either wide (usually cantilevered) roof eaves, in steel or wood, or a wide, sheltered arcade. These arcades generally rise to the level of roof clerestories and are supported on simple pipe supports.

Figure 147. Pacific Palisades Charter Senior High School (1961), Adrian Wilson & Associates, Pacific Palisades, west Los Angeles. Source: Sapphos Environmental, Inc., 2014.

Figures 148 and 149. Fernangeles Elementary School (1954), Sun Valley, San Fernando Valley. Image on the left shows the Administration Building and Auditorium; image on right shows the student lawn and landscaping, from the vantage point of sheltered outdoor dining area. Source: Sapphos Environmental, Inc., 2014.

Along the opposite side (meant for northern exposure), window glazing is generous, usually occupying 60 to 80 percent of the wall height in grouped, multi-light, operable windows. The grouping of windows marks the location of the classroom inside, and treatments vary, from wood-framed, multi-light double-hung sashes to steel-framed casements.

By the 1960s, it became more common to see double-loaded classroom wings (for senior high schools especially, but also for some elementary schools where demand was high and available acreage was scarce). By double-loading corridors but retaining the preferred one-story massing, schools accommodated more students while also providing a more domestic scaled, indoor-outdoor campus. Also in the early 1960s, for sites with less acreage, campuses incorporated more two-story buildings, with designs still drawing upon the postwar ideals for an informal, indoor-outdoor campus.

Many slight variations of another classic feature of postwar schools, sheltered corridors, appear on campuses throughout the district as well. Intended to move hallways outside, sheltered corridors might display wood plank and beam roof structures, resting on simple piers or steel pipe supports, capped with a flat or slightly sloped roof. Many examples form an elaborate network connecting all buildings and facilities of the campus.

Many LAUSD schools constructed during this period, from the late 1940s through the 1950s, also display standard campus components and site designs. Some basic elements include an auditorium, usually cited close to the public entrance to the campus, with a low, one-story entrance wing giving way to a two-story high interior. Stylistically, the auditorium generally reflects the character-defining features or influence of Mid-Century Modern design. Detailing is spare, and materials vary. For the auditorium, and usually for the equally public administration building, brick cladding and piers flank entrances and/or accenting building bases. Other typical materials include stucco, steel, and scored concrete.

The finger-plan school forms a spiral, allowing for the benefits of the landscaped, expansive site plan and low, one- and two-story deep classroom wings providing easy outdoor access and views. The use of the spiral plan creates these features on a relatively restricted lot. Source: Google Maps, 2013.

Figure 152. Leapwood Avenue Elementary School (1962), Carson; image on left shows two-story, double-loaded classroom; image on right shows landscaping and patios between classrooms, connecting corridors, and wide arcade eaves. Source: Sapphos Environmental, Inc., 2014.

Other common features for elementary, middle, and senior high schools included the incorporation of a centrally located, sheltered outdoor dining area and adjacent Cafeteria/Multipurpose Building, outdoor assembly area and landscaped lawn/quad and recreation fields along the periphery of campus (the latter two features are more common for middle and senior high schools). Elementary schools often incorporated a separate area for kindergarten classes. Usually located near the Administration building, the kindergarten areas have their own patios and recreation areas, adjacent to the classroom wing.

Postwar Expansion and Educating the Baby Boom

After the tumult of Great Depression and World War II, the Board of Education of Los Angeles, in spite of a turn toward architectural modernism, shifted away from the experiments of the 1930s and back toward a more traditional, college-focused curriculum. In September 1945, the Board of Education added its voice to a movement to carry out district-wide achievement testing for students and reevaluate the curriculum, partly in order to stop the "'drift toward laissez-faire, experimental, and lax methods.'"[135] The curriculum was revamped, with a renewed emphasis on the "3 Rs" and additional coursework in American history and geography.

The biggest challenge facing the district at the time was keeping up with demand. In Southern California, one of the areas with the most rapid growth was the San Fernando Valley. Between 1930 and 1950, population expansion in the valley was remarkable even for Southern California. With new settlers drawn by the area's emerging aerospace and entertainment industries, residential expansion had already been under way by the 1920s and 1930s. By the onset of the Great Depression, for example, the valley had become one of the United States' most important hubs for the aviation industry. Given this concentration of jobs, population doubled from approximately 51,000 in 1930 to 112,000 by 1940. With the advent of World War II and an infusion of federal funds for wartime spending, these figures skyrocketed by another 50 percent in 5 years, from 112,000 in 1940 to 176,000 by 1945. Between 1945 and 1950, a nearly fourfold increase was recorded, with figures climbing to 402,000. Given the magnitude of this expansion, a majority of post-1945 school construction for the district overall took place throughout the San Fernando Valley.

Figures 153 and 154. Chatsworth High School (1963), San Fernando Valley. Double-loaded axial classroom wings fan out from a spoke-like plan, centered on a landscaped quad area. Photo on the right shows detail of courtyard spaces and landscaping lining all classrooms. Source: Sapphos Environmental, Inc., 2013.

This created another challenge for the Los Angeles City school district. Overcrowding led to the need to offer "half-day" sessions for children, where attendance happened in shifts of half-days. Bond issues in 1946, 1952, and 1955 addressed the pressing need for new school construction, and the resulting funds paid for the construction and expansion of numerous schools.[136] The 1946 bond issue provided $75 million, which helped generate 66 new schools, with a total of over 2,300 classrooms, over 480 cafeterias, gyms, auditoriums, and other ancillary buildings.[137] In addition, over $7.8 million went toward land for new schools, $3.2 million for maintenance and improvements to an aging stock of facilities, $4.5 million for grounds improvements, and $10.6 million for equipment. In spite of these investments, another $148 million was proposed for a 1952 bond issue.

In 1948, district-wide enrollment stood at 301,000 students; by 1949, this figure had increased by 15,000, with enrollment reaching over 316,000.[138] By the end of the 1950s baby boom, however, the student population of the Los Angeles City school district more than doubled, climbing from 316,000 to over 645,000. A further increase of 28,000 pupils was predicted for the school year 1960–1961.[139]

Although the district temporarily succeeded in decreasing the need for half-day sessions in 1948–1949, by 1952 the sheer numbers threaten to overwhelm its ability to keep up. Without a new building campaign, the number of students needing to attend half-day sessions was predicted to increase from 11,355 in 1952 to 100,000 by 1957.[140] By 1965, in the San Fernando Valley, demand was so great that school district officials began predicting that school plants would soon occupy high-rises, a trend that was not desired but seen as a possibility.

Funding was not the only challenge facing the district. There was a pressing need for new construction, but also a shortage of trained architects in the immediate postwar years (this tide started to turn in the 1950s). In 1949, the State of California issued a "renewed plea for draftsman and designers," as the state's ambitious postwar building program for institutional construction was falling behind schedule due to a personnel shortage.[141]

These years profoundly impacted the growth and organization of the school district. The geographic area served by the school district fluctuated over time, expanding during the 1920s and 1930s as it annexed adjacent school districts and served new areas. As of 1935, the school district enrolled 300,000 students housed in 384 schools, including 293 elementary schools, 22 junior high schools, 35 high schools, a trade school, and a junior college; and it served an area of over 1,095 square miles.

During the late 1930s and 1940s, the general trend in school district organization was toward decentralization; as communities grew and developed their own identities, they might split off and form stand-alone districts. For example, between 1936 and 1945, the Beverly Hills, Torrance, Culver City, and William S. Hart Union High School districts formed after leaving the Los Angeles City School District.

Even so, throughout the district, enrollment steadily increased. Rapid postwar residential development perpetuated the need for funds for additional classroom space, facilities, equipment, and other resources. To examine apportionment of state aid to school districts, in 1954 the state legislature created the State Commission on School Districts and directed it to examine unification and other means of reorganization of school districts in the state. The state's policy thereafter was the encouragement of unification for reasons of streamlining administrative functions and costs, enlarging tax bases and reducing dependence on state aid. Developing suburbs were, accordingly, encouraged to align themselves with the existing Los Angeles City School District, further contributing to its growth.

Formation of the Los Angeles Unified School District

Through the 1950s, the Los Angeles City School District remained organized as three separate entities: an Elementary School District, High School District, and Junior College District. In the late 1950s, calls for unifying Los Angeles's elementary and high school districts into one unified entity began gathering momentum. The movement for district consolidation was seen throughout the region and state in this era. As of 1959, the State of California spent upwards of $1.5 billion for public education, spread across 1,721 separate districts, "a maze related to the state's unending growth."[142]

Supported by the State Board of Education, the Los Angeles City School District and Board of Education, as well as California's governor at the time, Edmund Brown, district unification would "bring advantages in curriculum, staff and financing."[143] Proponents of the measure argued that unification would help bring costs under control by streamlining administrative procedures and eliminating duplication. In addition, a unified district would also provide a "continuity of education along a solid plane from the kindergarten to the senior year," as Los Angeles City School District superintendent Ellis Jarvis argued.[144]

These efforts culminated in three ballot measures, Propositions C, D, and E, included in the 1960 national primary elections. The propositions easily passed. As of July 1961, the LAUSD came into being as the second largest school system in the United States, and the Los Angeles Junior College District became an independent entity.

Changing Times: LAUSD in the 1950s and 1960s

In 1960, the *Los Angeles Times* education editor, Dick Turpin, observed that "growth, the word most nearly synonymous with California, has brought many problems to the state and education has had a major share of them."[145] At this juncture for LAUSD, enrollment in 1959–1960 stood at 645,000; by 1960–1961, enrollment figures were expected to climb by 28,000 pupils.[146] The school year 1960–1961 also brought the opening and staffing of 15 new schools.

Caption, right image: "Thousands of teachers and supporters staged a mass demonstration in front of city hall." 19 September 1969. Source: LAPL, Shades of LA, #00058154.

The extended postwar boom of school construction and expansion had brought dozens of new schools to the district. Between 1946 and 1962, a total of $649.5 million in bond issues had funded the expansion. But population growth continued through the 1960s, exerting a constant pressure for new classrooms.

In 1962, the *Los Angeles Times* reported that California had become the most populous state in the nation and that this population boom was having a negative impact on the state's schools. As a result, LAUSD had increased half-day sessions for the first time since the 1950s, during the height of the baby boom. Half-day sessions had hit a high mark in 1957, with over 48,000 classes adopting the partial schedule; this number had steadily dropped in the intervening years. But by 1962, the numbers were again on the rise, with an estimated 20,000 half-day sessions needed in the fall of 1962. Other solutions, such as the temporary fix of busing students from overcrowded to less crowded schools, was one proposed but problematic solution in the early 1960s.

Even as the need to expand and upgrade continued, signs of voter fatigue for school bond measures were becoming evident. In 1962, a defeated bond measure of $128 million would have funded new schools and expansion in areas most impacted by enrollment increases and/or overcrowding, among them, the San Fernando Valley and central Los Angeles. By 1963, for example, enrollment in the San Fernando Valley accounted for one-third of the total for the district.[147] Even with the additional funds, keeping up with demand still would have proved onerous: "Had the measures passed," reported *Los Angeles Times* education editor Dick Turpin, "the city school system could barely have kept pace with the city's surging enrollment wave. Now additional half-day sessions are certain."[148]

Through the 1960s, however, the tide continued to turn against school bond measures. In 1969, for the fourth time in a row, Los Angeles voters rejected a tax increase to provide funding for "the already troubled Los Angeles city schools. A bond issue for the construction of new schools was also a victim of nonsupport."[149] This trend was statewide: joining Los Angeles voters in this rejection of school bond measures were Culver City, Ventura, and San Diego, among many others. Between 1966 and 1968, "52 percent of all propositions designed to provide more funds for California schools ... have been defeated."[150]

In an editorial in the *Los Angeles Times*, Warren L. Steinberg, a consultant with LAUSD's Center for Planned Change, commented on the trend:

> California businessmen and politicians—in addition to exploiting the beauties of the California scenery and climate—have long attributed much of the success in luring business to the state to an educational system that provides a large source of skilled manpower. Again, why do Californians reject support for one of the state's most precious assets—schools? Some will answer that it is a taxpayers' revolt, that school taxes are the only taxes on which the average citizen gets to vote and that there is no other way that the individual can show his wrath at the steadily climbing tax bite.

Steinberg captured the mood of the era, not just with respect to funding, in his concluding comments in the piece:

> Our children need to ponder basic educational problems: When will equal educational opportunity be a reality, what is the place of religion in the school, what should be taught in the schools, how much is good education worth, what is the role of home and school, how free should academic freedom be, what part should students have in determining the education they will receive? Unless schools turn out a better educational product and begin to teach students the history and place of education in our society, we can expect more propositions to fail their ABCs. [151]

As the decade ended, though, the "voter revolt" against school bond measures continued, and Los Angeles city schools were tasked with serving a substantial student population with ever-diminishing resources. In 1969, for the first time in its history, LAUSD's student enrollment dropped. The news made headlines in the *Los Angeles Times*: "'This is a new development for us,' said a surprised Asst. Supt. Frederick Fox. 'The trend (of growth) has been broken.'"[152]

Civil Rights and School Integration

As the 1960s ended with this novel news—of an enrollment decrease—school officials cited the dual causes of decreasing birth rates as well as the widespread move of many families to new suburban areas outside the district. An additional factor in this shift was increasing racial tension and growing pressure on the district to correct the racial imbalance that had become evident in many schools.

In the postwar period, addressing and correcting decades of de facto racial segregation represented a significant challenge for LAUSD.[153] By the 1960s, as the Civil Rights movement gained momentum, this long-brewing issue finally came to a head and formed an important part of the social context shaping the district during this time.

Throughout the early twentieth century, racial discrimination and segregation in housing had been reflected in the demographics of Southern Californian schools. A new wave of openly discriminatory housing practices in the 1930s helped maintain and worsen these divisions. In the mid- to late 1930s, surveyors for the Home Owners Loan Corporation (HOLC) studied the demographic breakdown of communities throughout the United States, including in Southern California. The HOLC provided long-term mortgage loans to, mostly, Anglo-American clients. In addition to discriminating against potential clients, the HOLC's "security maps" helped lenders discriminate against entire neighborhoods. In this climate, ethnic diversity was considered to be a security risk.

In order to document the presence of what they termed "subversive races," HOLC surveyors went block by block throughout Los Angeles, interviewing residents and creating neighborhood profiles describing, among other things, racial composition. Hundreds of data sheets, with detailed demographic information, were created for Los Angeles alone. Neighborhoods would be assigned a color denoting the level of risk, with an inordinate amount of weight being assigned on the basis of who lived there: green usually meant that a

neighborhood was entirely Anglo-American; yellow meant that a few ethnic minority members lived in the neighborhood; and red was reserved for neighborhoods with predominantly minority populations, usually African-American.

Figure 165. 1963 hunger strike by school integrationists: "A year-long study on the subject of de facto segregation was scheduled to be presented to the Board of Education." Source: LAPL, Shades of Los Angeles, #00041605.

This practice, which became known as "redlining," fueled discrimination and racially restrictive lending practices and intensified segregation in Los Angeles.[154] As restrictive housing and lending practices continued in the postwar period, racial segregation became particularly pronounced in newly constructed suburbs, in particular in the San Fernando Valley. The student populations of schools reflected this: "The Valley, regardless of the region—North, East, or West—was by far the most racially segregated region of the Los Angeles School District," according to a 1967 report released by the school district.[155] Among thousands of students at Birmingham, Canoga Park, Chatsworth, Cleveland, Granada Hills, Grant, Reseda, Taft, and Van Nuys high schools, there was a combined total of 19 African-American students.[156]

However, additional factors contributed to the marked racial imbalance in so many Los Angeles public schools. As architectural historian Teresa Grimes, et al., noted:

> According to Josh Sides, school segregation in Southern California was the product of racial geography, willful neglect, and racial gerrymandering. In this respect, the civil rights battle over education was very much tied to housing. If black families were restricted to living in certain areas with substandard schools, there was de facto school segregation.
>
> While the LAUSD officially mandated that students attend the school closest to them, white students in racially mixed neighborhoods were able to seek a waiver and attend a predominately white school. This practice, combined with segregated residential patterns, resulted in de facto segregation well into the 1950s. When the NAACP started investigating the schools system in 1953 and U.S. Supreme Court handed down the landmark Brown v. Board of Education case in 1954, schools became a central focus of the Los Angeles civil rights movement. Resistance from both the LAUSD and white parents in affected neighborhoods throughout the city led to a protracted battle over school desegregation well into the 1970s.[157]

Figure 166. The "East LA Blow Out," Lincoln High School, 16 September 1968. Students protested for "better schools for Mexican Americans. Sal Castro was a teacher there and spearheaded the movement." Source: LAPL, Herald-Examiner Collection, 00041327.

In the early 1960s, the NAACP and the American Civil Liberties Union (ACLU), along with a coalition of other organizations, launched a campaign of sit-ins, marches, and other nonviolent action, calling upon the Los Angeles Board of Education to adopt policies aimed at correcting racial segregation and broadening the curriculum. This coalition asserted the need for (1) the Los Angeles Board of Education to redraw its school boundaries, (2) black students in overcrowded schools to elect to attend predominantly white schools, and (3) black teachers to be hired throughout the district.[158] By the mid-1960s, a variety of groups joined forces, arguing for classes and subjects more reflective of the diverse histories and cultures of LAUSD students.

The issue also touched on school boundaries. In 1963, African-American leaders in Los Angeles staged protests, asking that "elementary and secondary school boundaries be redrawn around these 'Negro districts,' that that minority students be transferred from crowded schools to less crowded ones in a 15-mile radius, and that "barriers" to promotion of certified Negro personnel be eliminated."[159] With the Watts uprising in 1965, attitudes were intensified on all sides of the integration issue. Some citizens became more adamant that de facto segregation should remain in place, while other community members, activists, and students began arguing for and asserting the legal rights of all students to equal educational facilities and opportunities.

In 1968, Latin-American students in East Los Angeles staged a series of school strikes popularly known as the "East L.A. Blowout."[160] During the first week of March 1968, approximately 15,000 students walked out of classes at Woodrow Wilson, Garfield, Abraham Lincoln, Theodore Roosevelt, Belmont, Venice, and Jefferson high schools with demands for an "equal, qualitative, and culturally relevant education."[161]

Early Litigation

In 1954, in the landmark case *Brown v. Topeka Board of Education,* the U.S. Supreme Court declared that separate public schools for black and white children were "inherently unequal" and therefore violated the constitutional rights for equal protection for minority children.[162] Impacts of this decision were felt in Southern California. The Los Angeles Board of Education had cited "color-blindness" as its official policy, stating that racial segregation in housing patterns was beyond their control.[163] However, when the policies of the nearby Pasadena School Board (which mirrored those of Los Angeles) were challenged in a 1963 lawsuit brought by the National Association for the Advancement of Colored People (NAACP), the California Supreme Court ruled that school boards must attempt to eliminate racial segregation, regardless of its causes.[164]

In 1963 in Los Angeles, the ACLU filed *Crawford v. Los Angeles City Board of Education*, a class-action school desegregation lawsuit filed behalf of two African-American high school students, Mary Ellen Crawford and Inita Watkins.[165] The lawsuit highlighted two schools—both located in the southern portion of the district, only one mile apart—with pronounced racial imbalance: Jordan Senior High School in Watts, whose student population was 99 percent African-American, and South Gate Senior High School, which had 97 percent Anglo-American students.[166]

The case of *Crawford v. Los Angeles City Board of Education* became a watershed for Los Angeles schools. Filed in 1963, and effectively ending in the U.S. Supreme Court in 1982, the case "encapsulated and propelled the legal and political framework of an era."[167] As a result of the lawsuit, the California Supreme Court ordered LAUSD to formulate a plan to correct de facto racial imbalance in the schools. The most controversial solution proposed and implemented was busing students; programs were first established on a voluntary basis, then in a mandatory program that was hotly debated from the 1960s through the early 1980s, when a constitutional amendment passed by California's voters and affirmed by the U.S. Supreme Court ended the practice.

Crawford v. Los Angeles City Board of Education initially sought to halt the expenditure of public funds to renovate Jordan Senior High School until it was desegregated.[168] The suit was filed in 1963 but amended twice: in 1966, it was broadened to include Mexican-American students, and in 1968, the ACLU further amended the case to call for district-wide desegregation.[169] In 1970, as a result of lawsuit, a Los Angeles City Superior Court affirmed the presence of segregated schools in Los Angeles and ordered the district to take steps to correct racial imbalance. This prompted "a protracted fight over how to desegregate the increasingly diverse and increasingly racially segregated Los Angeles Unified School District."[170]

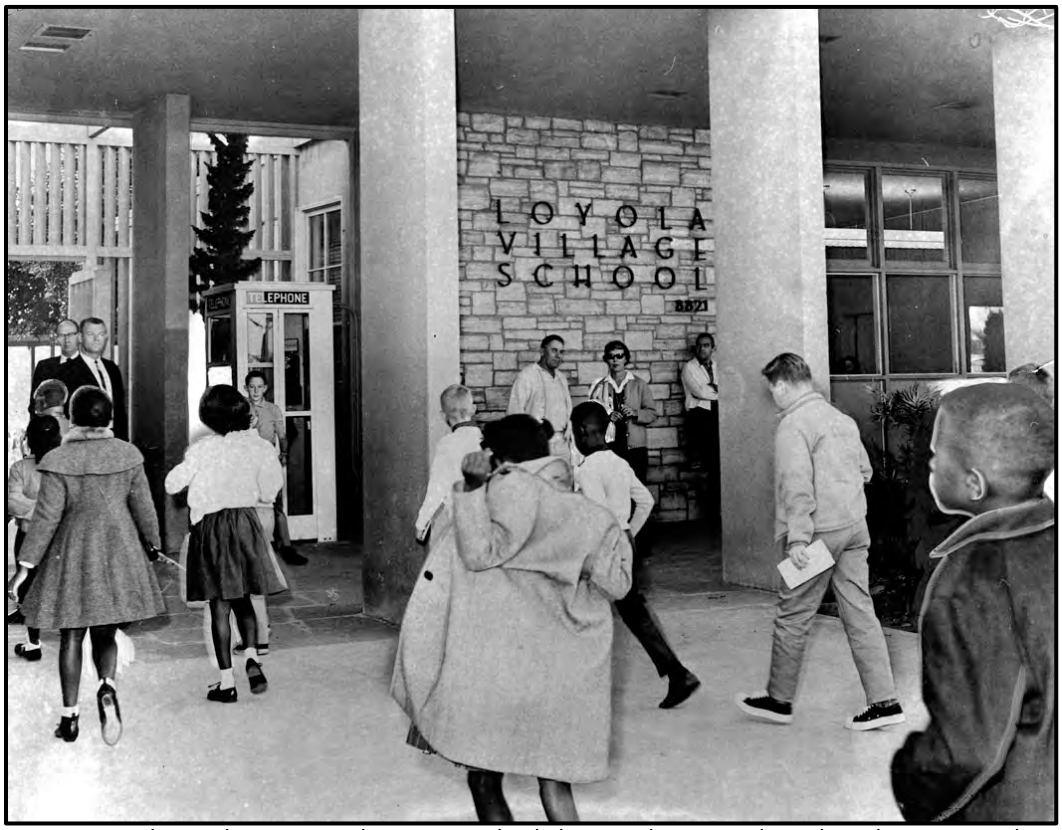

Figure 167. Voluntary busing as a solution to racial imbalance and overcrowding: This February 1964 photo shows children from Manchester Avenue School entering Loyola Village School. The caption read, "The transfer program is designed to cut half-day sessions at schools which are overcrowded by transporting pupils to schools with undersized classes." Source: LAPL, Herald-Examiner Collection, #LAPL00041639.

As mentioned, the most controversial solution involved busing students to correct racial imbalance as well as overcrowding. As early as the 1950s, and increasing in the 1960s, many communities and schools within LAUSD began exploring busing programs. In 1964, much attention was paid to a busing exchange program between relatively new schools in western Los Angeles (Loyola Village Elementary School and Osage Avenue School) and schools in older, more urbanized sections of Los Angeles (Manchester Avenue Elementary School and 66th Street School). In September 1967, a parents' group in Pacoima, in the San Fernando Valley, succeeded in establishing a busing program for 60 Pacoima students; the students would be taken by bus to the predominantly Anglo-American Encino Elementary School.[171]

During this period, in the late 1970s, two schools launched a voluntary, experimental program. Hobart Boulevard Elementary School, a multiracial school within the City of Los Angeles, partnered with Dixie Canyon Elementary School in the San Fernando Valley. In a program funded for a limited time by the Los Angeles School Board, approximately 70 second- and third-grade students from each school made the half-hour trip by bus to attend their partner school for a semester. The next semester, a new group of children would participate in the program. When the program was approved, the *Los Angeles Times* described it as "two schools, and one big step to integration": "The Anglo parents sat for more than two hours making a decision. Carefully, thoughtfully, they weighed the arguments. … But when the meeting was over, more than 100 parents of children in Dixie Canyon Elementary School in the San Fernando Valley agreed to participate in a voluntary two-way integration plan with Hobart Boulevard Elementary School, a multiracial inner-city school."[172] Writing in support of the program in the *Los Angeles Times*, Judith R. Birnberg, a Dixie Canyon Elementary School parent, stated that

> Socially, Hobart couldn't be more ideal: children attending the school have come from 42 different countries, and such a mix is already affecting my son. …Too many parents base their resistance to integration on the unknown. They assume minority schools are inferior, they assume the time traveling by bus will be a burden to their children; they assume children are haunted by the same fears clouding their own lives. But the time has come for parents to learn from their children.[173]

In 1977, in response to a California Supreme Court ruling calling for a "reasonable and feasible" integration plan, the Los Angeles Board of Education designed a program for mandatory busing. Under the plan, approximately 55,000 fourth- through eighth-grade students would be bused to school in 1978, with an estimated 112,000 students to follow in 1979.[174] The program was controversial and contested on a number of fronts. Just two years after the Los Angeles Board of Education proposed its plan, California's Proposition 1 sought to reverse it through a constitutional ban on mandatory busing. On the ballot in November 1979, Proposition 1 passed handily, with 70 percent of voters supporting the end of the practice.[175] On appeal in 1982, the US Supreme Court found Proposition 1 constitutional and upheld the ban on mandatory busing.

While this ruling solved one question, the issue of racial imbalance, cultural sensitivity in hiring practices and curricula, and encouraging diversity continued to shape the local- and state-level conversations about public schools through the 1960s, into the 1980s, and beyond. This issue continued to unfold in the courts on many fronts, as well as local and state governmental offices, school boards and classrooms, communities and families throughout Southern California. In this way, civil rights, ethnic identity, culture, and equal access shaped the sociopolitical context for school districts such as LAUSD in this period.

Summary: The Postwar Modern, Functional School Plant

In the postwar period, the functional modern school plant quickly became the norm throughout the United States and in Los Angeles. As school districts struggled to keep up with demand, architects had ample opportunities to test new ideas. The emphasis on the child-friendly school meant a continuing focus on improving and standardizing environmental controls, such as lighting, ventilation, heating and cooling systems, and interior design. While three main plan types emerged during this era—the finger-plan, cluster-plan, and open-plan school—there were many combinations and variations on the basic themes. Stylistically, as well, postwar schools might exhibit textbook features of the International Style, more regionally inflected modernism, or variations on the styles popular in the postwar period.

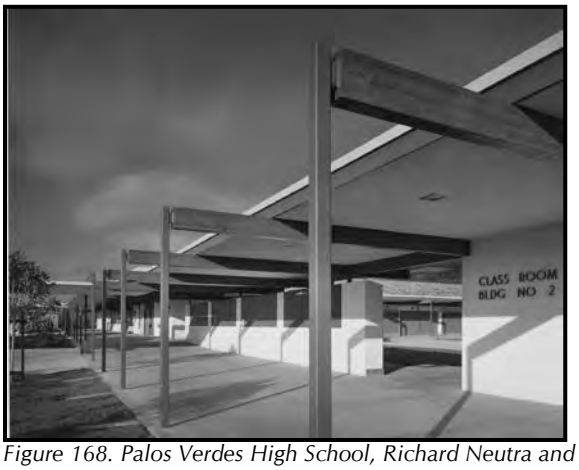

Figure 168. Palos Verdes High School, Richard Neutra and Robert Alexander (1961). Source: The J. Paul Getty Trust, Getty Research Institute, Julius Shulman Archives.

First and foremost, the postwar school was designed to be more informal, accessible, and child-friendly. A more accessible school generally signaled lower massing, though junior and high schools might still climb two or three stories, especially given the pressing need for more schools. In general, the preferred, more domestic scale was reflected in one-story massing and low ceilings, which made classrooms more intimate. Generous panels of glazing provided light and outdoor access, with larger windows on north elevations and often clerestory windows on southern sides, to balance cross-lighting. With the advent of air-conditioning, schools in the early 1960s tended to diminish generous expanses of glazing. The need for economical construction and finely tuned environmental features and controls accompanied a continued national call for standardization of school design.

Campus planning and site-specific design also became increasingly important, as new residential areas emerged from former agricultural lands, and school builders and planners had the acreage to plan an entire campus created for new residential communities. In this era, ideas about planning at the scale of the neighborhood included the generous use of outdoor spaces and landscaping and a zoned design that turned the campus inward and separated pedestrians and automobile traffic, for safety and accessibility. Although many variations were proposed, the modern campus plan called for "small separate units connected by arcades or passageways and attractively grouped. This type of arrangement is quite flexible and eliminates much of the institutional atmosphere of the large compact structures."[176]

SECTION IV ARCHITECTURAL CHARACTER

As described in Section III, early-twentieth-century reform brought a more functional approach to school design throughout the United States. Priorities shifted, and designing according to function rather than style became the starting point for architects and builders. In this way, Los Angeles's public schools generally display a scale and function that are unique to their purpose as educational facilities. Even so, as the focal point for the community's identity and commitment to education, public schools also showcased outstanding architectural design by the region's leading practitioners. Throughout the twentieth century, the public schools of Los Angeles have reflected both the increased emphasis on functionality as well as the significant stylistic trends of the day.

The following summary of the typical architectural styles reflected in LAUSD schools serves to introduce the topic and sketch the main character-defining features and eras for each style. This section draws upon and expands the architectural character section of the 2002 LAUSD Historic Context Statement and presentation prepared by Leslie Heumann & Associates and Science Applications International Corporation of Pasadena, California.[177] This updated version draws upon additional field observations, as well as recognized guides and studies.[178]

In order to ensure cross-agency compatibility, the authors of this section also considered and adapted, where appropriate, the standards used by the City of Los Angeles Office of Historic Resources and Department of Planning for historic resource surveys.

This section is not intended to be an exhaustive list of styles but rather an introduction and general framework for understanding the principal styles, as well as stylistic evolution, of LAUSD school plants. Descriptions of each style include the general period during which the style was used and its typical character-defining features.

The broad stylistic categories presented here were compiled with an understanding that architectural design is more dynamic than a fixed label might suggest. Styles and trends come together through a combination of architectural precedent, historical interpretation, creative license of designers, and the agency of clients. Therefore, architectural styles are best understood as cultural hybrids incorporating elements from a variety of sources. In this way, these descriptions offer a broad palette for identify stylistic influences and character.

LATE-NINETEENTH-CENTURY STYLES

Some of the earliest schoolhouses built in Los Angeles were one- and two-story, vernacular-type wood buildings, generally modeled at the scale of domestic and small civic buildings and easily enlarged or modified to accommodate growth or multiple uses. During this era of school construction, the bell tower, echoing church design, was introduced as a signature element. Three known examples of Los Angeles's early wood-framed schoolhouses have survived; in Los Angeles, this construction type was in use from the earliest years of the district through approximately 1910. The library building at Canyon Elementary School, for example, was built in 1894.

Typical Character-Defining Features:

- One- to two-story massing
- Wood-framed construction
- Horizontal wood or wood shingle siding
- Open cupola or bell tower
- Simple vernacular exteriors, or Queen Anne or Colonial Revival detailing
- Wood-framed, double-hung sash windows, often in groupings

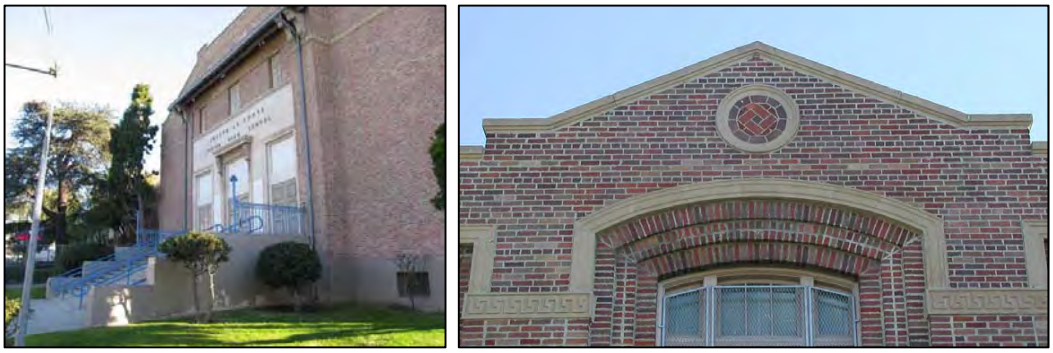
EARLY TWENTIETH CENTURY: BEAUX-ARTS CLASSICISM & NEO-CLASSICAL REVIVAL

Early twentieth-century buildings brought a new architectural vocabulary to LAUSD school design. The monumental classical motifs of Beaux Arts Classicism, evident in courthouses and city halls accommodated a new scale of two and three stories. This scale was demanded by expanding enrollment and a need for increased capacity and rooms differentiated by grade level and curriculum.

Beaux Arts Classicism and Neo-Classical Revival styles were especially favored by designers following the lead of McKim, Mead and White and other prominent national firms. The impressive porticos, with classical orders and colossal columns, advertised the importance placed on public education. Primarily of masonry construction, most of these schools fell victim to the 1933 Long Beach Earthquake. The San Fernando Middle School Auditorium, constructed as part of a 6-year high school in 1916, is one of the few remaining examples of this era.

Figure 172. A rare remnant of the Neo-Classical era in school design: San Fernando Middle School, Auditorium, John C. Austin, architect (1916). Source: Heumann & Associates and SAIC for LAUSD.

Figure 173. Detail, San Fernando Middle School (1916). Source: Heumann & Associates and SAIC for LAUSD.



Typical Character-Defining Features:

- Monumental scale
- Formal, symmetrical design composition
- Smooth stone, masonry, or concrete exteriors (often scored to resemble masonry)
- Elaborated entrance, often featuring portico with columns
- Classical detailing, such as use of gables and entablature, columns, and pilasters
- Multilight grouped windows with wood surrounds

EARLY TWENTIETH CENTURY: INDIGENOUS REVIVAL STYLES AND THE ERA OF HISTORIC ECLECTICISM

As of 2013, a substantial number of LAUSD's remaining school buildings were constructed between the early 1920s and World War II. These schools reflect the eclectic menu of revival styles popular at the time for a range of building types. Period-revival styles seen in LAUSD schools include Italian Renaissance Revival, Collegiate Gothic Revival, and Tudor Revival. In addition, for Southern California's emerging architectural profession and academy, this era brought a new emphasis on the region's indigenous architectural traditions and a desire to infuse design with local character. Indigenous revival styles that rose in popularity during this period included, most notably for LAUSD public schools, the Spanish Colonial and Mission Revival. Designers expressed regional character and flavor by relating buildings to the outdoors, with one-story schools easily opened to exterior spaces, and by providing open loggias and arcades for circulation.

Where design was a priority, the stylistic program of the school is generally most clearly expressed in the campus's public buildings, such as the auditorium or administration building, and at primary entrances to buildings or classroom wings.

MISSION REVIVAL AND SPANISH COLONIAL REVIVAL

Beginning with efforts to restore California's missions in the late nineteenth century, Southern Californian architects began looking toward regional history for stylistic cues. The region's climate and Hispanic heritage figured prominently in these new directions. The Mission Revival vocabulary, most popular between 1890 and 1920, drew inspiration from Southwestern missions. Identifying features include curved parapets and red tiled, low-pitched roofs. Arches were used liberally, and wall surfaces commonly displayed smooth stucco. The Spanish Colonial Revival flourished between 1915 and 1940, reaching its apex during the 1920s and 1930s. This movement was catalyzed by architect Bertram Goodhue's 1915 designs for Panama-California Exposition in San Diego. The Spanish Colonial Revival style became one of the most popular idioms for a range of building types. Architects and builders embraced the style, which was employed for many LAUSD schools. The rise in popularity of the Spanish Colonial Revival style also coincided with the move toward more child-scaled schools, with lower massing and open, expansive campuses. With its emphasis on arcaded corridors and patios, the style fit this movement particularly well.

Spanish Colonial Revival buildings tend to be asymmetrical and sheathed with smooth stucco. Roofs generally consist of gabled, gabled and flat, and (less commonly) hipped roofs, clad in red clay tiles. Arched openings, whether for windows, doors, or gates, are a textbook feature. Secondary materials—including wood, wrought iron, and polychromatic tile—provide decorative accents. Windows are generally wood framed or metal, with molded wood surrounds or lintels.

Typical Character-Defining Features:

- Stucco-clad walls (usually smooth finish); occasionally might have brick or cast stone
- Asymmetrical design
- Use of towers, turrets, or cupolas
- Low-pitched gabled or hipped roof covered in red clay tiles or flat roof with parapet wall
- Shallow eaves or deeper eaves, lined with exposed carved wood brackets
- Arched openings for windows, doors, and use of arcades
- Secondary materials can include wrought iron, polychromatic tile, and cast stone
- Exterior patios and courtyards

RENAISSANCE REVIVAL STYLE

In the late nineteenth and early twentieth centuries, the Renaissance Revival style began as a fairly literal translation of sixteenth-century Italian *palazzi* into two- and three-story buildings. The style evolved into one of the most popular of the 1920s, in particular for midrise office buildings. McKim, Mead, and White designed some of the United States' most elegant expressions of the revival during its earlier years. During the 1920s, local architects such as Walker and Eisen and John and Donald Parkinson designed many of Los Angeles's best examples.

Renaissance Revival buildings in Southern California are generally sheathed in brick or stucco. Facades are symmetrical or highly regular and divided into bays by the fenestration pattern or by piers, which are often treated as columns with bases and capitals. Variations in surface finishes, fenestration, and level of detail visually distinguish each section, creating a horizontal emphasis that is reinforced by prominent belt courses. A cornice, set above a frieze and/or architrave, traditionally tops a Renaissance Revival building. Windows on top stories are often distinguished from lower stories by different surrounds and configuration.

Figure 180. El Sereno Middle School, originally Woodrow Wilson High School (1937). Source: Heumann & Associates and SAIC for LAUSD.

Typical Character-Defining Features:

- Rectangular massing
- Brick, stucco, and concrete, with trim of terra cotta or cast stone and bases of granite or masonry
- Horizontal emphasis; differentiated treatment of stories
- Symmetry and regularity
- Brick, stucco, or concrete exterior, often scored to resemble masonry
- Gabled and/or hipped roof, often sheathed in clay tiles
- Linear fenestration pattern
- Belt courses and cornices
- Classical detailing
- Cast stone or terra cotta architectural ornament

Figure 181. University High School (1924). A spring located on the school campus is registered as California Historical Landmark No. 522; the spring marks the location of three significant events: where the Portola Expedition camped in 1769, Father Junipero Serra gave Mass in 1770, and where the City of Santa Monica once obtained its water supply. Source: Heumann & Associates and SAIC for LAUSD.

GOTHIC REVIVAL / COLLEGIATE GOTHIC

Popularized by writers and art critics such as John Ruskin (1819–1900), the English Gothic Revival movement looked back to and idealized the preindustrial Medieval era as a more pure and moral golden age, for society as well as for architecture. First popularized for religious buildings and for school buildings—the "Collegiate Gothic"—the style began appearing in the Los Angeles area in the late 1800s. Few buildings were constructed locally in this style, and even fewer remain.

Most extant Collegiate Gothic schools in Los Angeles were constructed during the height of the period-revival era. In the 1930s, in school design, the style fell out of favor as more up-to-date architectural idioms began emerging. The 1933 Long Beach earthquake, and then the 1934 Field Act, hastened the need for widespread school repairs and new construction, which accelerated the stylistic shift during this period.

Gothic Revival schools share the same emphasis on verticality that characterizes other applications of the style. The emphasis on the vertical is often expressed through the use of uninterrupted piers or attached ornament, which extend from the ground to the roof. The style also makes liberal use of mullions, towers, spires, and pinnacles. Windows are arranged in vertical channels of glass, sometimes topped with pointed arches. Brick and concrete were the materials of choice, often accented by cast stone.

Typical Character-Defining Features:

- Concrete or brick exterior
- Emphasis on the vertical axis
- Attenuated windows and openings
- Use of full-length columns or pilasters
- Steeply gabled roof
- Liberal use of cast stone or terra cotta ornament and sculptural detailing
- Stylized openings, with Tudor, pointed, or round arches
- Windows and doorways outlined with archivolts and topped with decorative crowns
- Windows with mullions

ART DECO

As architects and designers began exploring alternatives to historic revival styles, one of the earliest modern alternatives was Art Deco. The term grew out of the 1925 exposition in Paris showcasing the "nouveau," or new directions in design and decorative arts, at the *Le Musee des Arts Decoratifs*.

The idiom is highly decorative but rejects copying or adapting historical revival styles. Instead, ornamentation draws on geometric and foliate patterns and motifs, such as zigzags and chevrons, light, and color. Primarily in use between the 1920s and 1930s, the style was used most often in commercial, industrial, and institutional buildings.

Typical Character-Defining Features:

- Emphasis on verticality through building massing, applied exterior features, and ornament
- Use of stylized, geometric motifs and decorative features, such as zigzags and chevrons
- Generally features smooth stucco- or concrete-clad wall surfaces
- Often features towers or other elements projecting beyond the roofline
- Often features steel-frame casement and fixed windows

Figure 185. PWA Moderne with Art Deco influence: Florence Nightingale Middle School, John C. Austin & Frederick M. Ashley, architects (1937-1939). Source: Heumann & Associates and SAIC for LAUSD.

Figure 186. Streamline Moderne: Thomas Jefferson High School, Stiles O. Clements (1933). Source: LAUSD.

STREAMLINE MODERNE | MODERNE

The Streamline Moderne became a popular style during the Great Depression and World War II period. Its clean lines and minimalist ornament both celebrated the modern machine-age and signaled the period of austerity triggered by the Great Depression. Compared with its more ornamental predecessor, the Art Deco style, Streamline Moderne is more restrained in its ornamental program and emphasizes the horizontal rather than the vertical. This is achieved through incorporating bands of windows, decorative raised or grooved horizontal lines, flat canopies with banded fascia, and narrow coping at the roofline. Other characteristics include smooth wall surfaces, usually clad in stucco, glass block or porthole windows, and rounded corners. Reference to aerodynamic design is a signature of the style.

Compared with the Streamline Moderne, Moderne buildings also tend to be horizontal in emphasis but more clean-lined and rectilinear in their massing and detailing. Moderne designs are generally characterized by flat roofs, smooth stucco exteriors, and use of metal casement windows that often meet at the corners of the building.

Typical Character-Defining Features:

- Horizontal emphasis, massing, and accents, such as moldings and continuous sill courses
- Smooth stucco or concrete exterior finish
- Curvilinear/rounded wall surfaces, corners, and features
- Recessed windows with no surrounds
- Flat or nearly flat roof

PWA MODERNE

Created by the National Industrial Recovery Act, the Public Works Administration (PWA) was founded within a few months of the March 1933 Long Beach Earthquake. Following widespread damage to Los Angeles public schools in the wake of the earthquake, much school reconstruction work was funded by the PWA. Consequently, a substantial number of Los Angeles public schools either built or remodeled during this time exhibit some degree of PWA Moderne styling. Also referred to as "Stripped Classicism," the PWA Moderne often incorporates elements of a number of styles, including Classical Revival, Spanish Colonial Revival, Art Deco, and Streamline Moderne.

Compared with the Streamline Moderne, the PWA Moderne was more formal and symmetrical in its overall design, with less emphasis on curvilinear shapes and horizontality. This style is found throughout the United States, particularly for institutional buildings funded through the PWA. Although the PWA program was terminated in 1943, buildings continued to display these stylistic features.

Typical Character-Defining Features:

- Emphasis on the vertical axis
- Symmetrical, formal design composition and massing
- Smooth wall surfaces, generally exhibiting stucco, concrete, and/or polished stone (rarely includes brick exterior elements)
- Usually displays a flat roof
- Piers, often fluted or reeded, separating recessed window channels
- Incorporation of shallow relief panels and interior murals

EARLY MODERNISM | INTERNATIONAL STYLE (PRE-1945)

This style coincides with the emergence of modern architectural design and culture in Los Angeles, at a time when modernism was still in an experimental stage and carried out by a relatively small group of architects and designers. Although many of these same ideas informed postwar modern styles, this era was unique and experimental. The City of Los Angeles Office of Historic Resources describes this stylistic theme as follows:

> With precedents in Europe dating to the first decades of the twentieth century, Los Angeles was one of the first American centers of the International Style due in large part to the import of ideas by Viennese expatriates Rudolph Schindler and Richard Neutra. Although never catching on as a widely-accepted style for domestic architecture, the International Style was embraced and regionalized by a number of Los Angeles architects and designers who established a formidable local Modernist tradition.
>
> Rudolph Schindler came to Los Angeles from Austria in 1920 to oversee construction on the Barnsdall House (Hollyhock House) for the office of Frank Lloyd Wright. Fellow Austrian Richard Neutra came to Los Angeles at Schindler's urging in 1925. Schindler, Lloyd Wright and Neutra and the architects of the so-called "Second Generation" architects continued to design buildings in Los Angeles in the postwar years; however, by this time the work of these architects and their protégés took on an expression of a more regional modernism (see Mid-Century Modernism).[179]

Typical Character-Defining Features:

- Horizontal emphasis
- Use of simple, geometric volumes
- Smooth, unadorned wall surfaces, often sheathed in stucco or concrete
- Flat or nearly flat roof, often with cantilevered eaves
- Use of corner and casement windows, often with steel frames
- Windows generally set flush with the wall plane, with minimal trim or surrounds
- Continuous bands of windows emphasize the horizontal axis

Figures 193 and 194. On left, Fernangeles Elementary School (1954), Sun Valley. On right, Parmlee Avenue Elementary School (1962), southeastern Los Angeles. Source: Sapphos Environmental, Inc., 2014.

MID-CENTURY MODERNISM / REGIONAL MODERNISM (POST-1945)

Mid-Century Modernism, or Regional Modernism, represents a middle ground between the formal, machine-age aesthetic of the International Style and a regional idiom reflecting local precedent and identity. In the postwar period through the 1960s, as practiced in Southern California, Mid-Century Modernism took its cues from the region's first-generation modernist architects such as Richard Neutra, Rudolph Schindler, Gregory Ain, Frank Lloyd Wright, and Harwell Hamilton Harris. In the postwar period, second-generation practitioners such as Raphael Soriano, Whitney Smith, and A. Quincy Jones, among many others, established Los Angeles as a center for innovative architectural design and culture.

Mid-Century Modernism is characterized by an honest expression of structure and function, with little applied ornament. Aesthetic effect is achieved through an asymmetrical but balanced, rhythmic design composition, often expressed in modular post-and-beam construction. Whether wood or steel, post-and-beam construction allowed for open floor plans, ease of expansion, and generous expanses of glazing to heighten indoor-outdoor integration. Infill panels of wood or glass are common, with glazing often extending to the gable. Buildings are generally one to two-stories, with an emphasis on simple, geometric forms. Capped with low-pitched gabled or flat roofs, a Mid-Century Modern building often displays wide eaves and cantilevered canopies, supported on spider-leg or post supports. Sheathing materials vary, with wood, stucco, brick and stone, or steel-framing and glass. Windows are generally flush-mounted, with metal frames.

Figure 195. Pacoima Middle School, Administrative Building (1955), Wilmington. Source: LAUSD Pacoima Middle School Pre-Planning Survey, 2010.

Figures 196 and 197. Grover Cleveland High School, Administrative Building (left) and typical classroom wing (right), Matcham & Granger and Associates (1959), Reseda. Source: Sapphos Environmental, Inc., 2013.

This style was seen in postwar institutional and commercial buildings, as well as residences, from 1945 until circa 1975, when Title 24 restrictions on the use of glass curtailed the expansive glazing that characterizes the style.

Typical Character-Defining Features:

- Horizontal design composition and massing; generally one to two stories
- Simple, geometric volumes
- Flat or shed roof, often with wide, cantilevered overhangs
- Exterior materials include stucco, brick, or concrete
- Modular design and planning
- Aesthetic qualities derive from use of simply treated materials and excellent craftsmanship
- Direct expression of structural systems, often in wood or steel post-and-beam
- Lack of historicizing ornament
- Generous expanses of fenestration, including bands of grouped multi-light windows
- Extensive use of sheltered exterior corridors, with flat or slightly sloped roofs supported by posts, piers, or pipe columns

Figure 199. Palisades Charter High School, Wilson & Associates (1961). Source: LAUSD Palisades Charter High School Pre-Planning Survey, 2012.

Mid-Century Modernism | Expressionistic/Organic Subtype:

- Combines sculptural forms with basic geometric volumes
- Curved, sweeping wall surfaces
- Expressionistic roof forms, including butterfly, folded plate or barrel vault roof forms

ARCHITECTS

Since the early years of the district, the school buildings and campuses of LAUSD have been designed by some of the region's most prominent master architects region as well as the district's own architectural department. The following architects and firms were responsible for numerous designs of extant buildings throughout the district, since the early twentieth century:

- Thornton Abell
- Ain, Johnson & Day (Gregory Ain, Joseph Johnson, and Alfred Day)
- Robert Evans Alexander
- Allison & Allison (David Clark Allison and James Edward Allison)
- John C. Austin
- Austin and Ashley (John C. Austin and Frederic Ashley)
- Austin, Field & Fry (John C. Austin, Robert Field, Jr., Charles Eugene Fry)
- Edwin Bergstrom
- Daniel, Mann, Johnson & Mendenhall, DMJM (Phillip Daniel, Arthur Mann, Kenneth Johnson, Irvan Mendenhall)
- Stiles O. Clements
- Roland Coate
- Edelman and Zimmerman
- Sidney Eisenshtat
- Henry L. Gogerty
- Heitschmidt & Thompson (Earl Heitschmidt and Whiting Thompson)
- Frank Hudson
- Hudson & Munsell
- Stewart S. Granger
- Myron Hunt
- Hunt & Chambers
- Hunt & Burns
- Gordon B. Kaufmann
- George Lindsey
- Marsh, Smith, & Powell (Norman Marsh, David Smith, and Herbert James Powell)
- A. C. Martin
- Matcham & Granger (Charles O. Matcham Sr. and Stewart S. Granger)
- Alfred S. Nibecker
- Richard Neutra
- C.E. Noerenberg and Johnson
- Parkinson and Parkinson
- Charles Plummer
- Alfred Rosenheim
- Sumner Spaulding
- Spaulding & Rex (Sumner Spaulding and John Rex)
- William Stockwell
- Whiting Thompson
- Walker and Eisen
- Adrian Wilson & Associates

SECTION V THEMES OF SIGNIFICANCE

CONTEXT: PUBLIC AND PRIVATE INSTITUTIONAL DEVELOPMENT | EDUCATION
THEME: LAUSD | FOUNDING YEARS

Property Type:	Institutional/Educational
Property Subtypes:	Wood-Framed School House
Period of Significance:	1872 to 1894
Area of Significance:	Education
Geographic Location:	Citywide (rare)
Area of Significance:	A/1

Eligibility Standards:

- Is a rare example of an educational facility from the founding years of the Los Angeles City School District

Character-Defining Features:

- Retains most of the essential physical features from the period of significance
- Wood siding
- Bell tower; some Victorian-era ornamental detailing
- One-story massing
- Wood-framed, double-hung windows

Integrity Considerations:

- Should retain integrity of Design, Feeling, and Association from the period of significance
- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable alterations

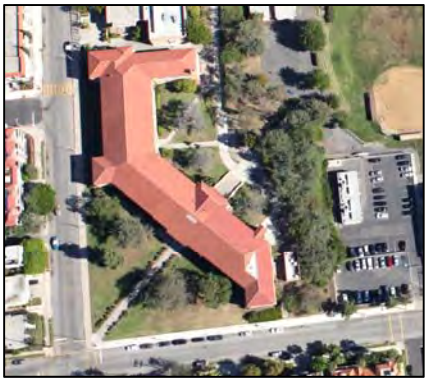

Figure 218. Old Vernon Avenue School, built in 1876. Source: LAUSD.

Figure 219. Old Canyon School, built in 1894. Source: LAUSD.

THEME: LAUSD | PRE-1933 LONG BEACH EARTHQUAKE SCHOOL PLANTS, 1920-1933

Pictorial Overview

Figures 220 and 221. The expansive plan and Renaissance Revival-style of University High School (1924). Designed open spaces have been retained for nearly a century. Source: LAUSD University High School Pre-Planning Survey, 2011.

Figures 222 and 223. Vernon City Elementary School (1929), with courtyards and Spanish Colonial Revival arcades placing school corridors outside. Source: LAUSD Vernon City Elementary School Pre-Planning Survey, 2011.

Figure 224. One-story scale and E-shaped plan of Fishburn Avenue Elementary School (1926), in 1927 aerial photo. Source: LAPL Photo Collection.

CONTEXT: PUBLIC AND PRIVATE INSTITUTIONAL DEVELOPMENT | EDUCATION
THEME: LAUSD | PRE–1933 LONG BEACH EARTHQUAKE SCHOOL PLANTS, 1910–1933

Property Type:	Institutional/Educational
Property Subtypes:	Elementary, Junior High, and High School Buildings and Campuses
Period of Significance:	1910 to 1933
Area of Significance:	Education
Geographic Location:	Citywide
Area of Significance:	A/1

Eligibility Standards:

- Embodies LAUSD school planning and design ideals and principles of the era
- One of few remaining schools from the pre–1933 Long Beach earthquake era that was not substantially altered or remodeled
- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features | Buildings/Structures:

- Articulated buildings plans, facilitating the creation of outdoor spaces (often T-shaped, E-shaped, U-shaped, and H-shaped plans)
- Generally low massing, usually one to two stories (with two to three stories more common for middle and senior high schools)
- Includes designed outdoor spaces, such as courtyards and patios, adjacent to classroom wings
- Exteriors usually lined with rows of grouped windows, including wood-framed multilight windows; expanses of windows often mark the location of classrooms
- Designed in popular period-revival styles of the era (including Spanish Colonial Revival, Renaissance Revival, Mediterranean Revival, and Collegiate Gothic)
- Often designed by prominent architects of the era

Character-Defining Features | Campus/District:

- Emphasis on a more spread-out site plan, with designed outdoor spaces
- More varied collection of buildings, differentiated by function and use (rather than a single building with all functions inside)
- Might include an elaborate administration building, usually the focal point of the campus, as well as classroom wings, auditoriums, gymnasiums, and outdoor recreation areas
- Middle or senior high schools might include a gymnasium designed in the style of the campus overall

Integrity Considerations:

- Most pre-1933 schools were substantially remodeled following the Long Beach earthquake
- Designed outdoor spaces, such as courtyards and patios, should be intact in use, if not with landscape design and hardscaping; development pressures over the years often resulted in these open spaces being in-filled with new construction; overall sense of relationship of building to designed outdoor spaces should be intact
- Should retain integrity of Materials, Design, Workmanship, Feeling, and Association from its period of significance
- Intact campus groupings from a single period of time are not common
- Some materials and features may have been removed or altered
- Modern lighting and fencing of site acceptable

Comments:
Schools from this period generally include additional buildings and structures added after the period of significance (in particular after World War II), which may be non-contributing.

Eligible properties under this theme may be a single building (generally the Administration Building, in combination with a classroom wings) or a grouping (campus) of buildings constructed during the period of significance.

Buildings and campuses exhibiting distinctive design features might also qualify under Criteria C/3, as the embodiment of the distinctive characteristics of a type, period, region, or method of construction, an excellent example of the work of a master architect, or for high artistic values.

Figure 225. Marshall Senior High School (1931). The school has expanded over the years but also retains many of its designed open spaces and courtyards. Source: LAUSD Marshall Senior High School Pre-Planning Survey, 2010.

CONTEXT: PUBLIC AND PRIVATE INSTITUTIONAL DEVELOPMENT | EDUCATION
THEME: LAUSD | POST–1933 LONG BEACH EARTHQUAKE SCHOOL PLANTS, 1933–1945

Property Type:	Institutional/Educational
Property Subtypes:	Elementary, Junior High, and High School Buildings and Campuses
Period of Significance:	1933 to 1945
Area of Significance:	Education
Geographic Location:	Citywide
Area of Significance:	A/1

Eligibility Standards:

- Exemplifies post–Long Beach earthquake school planning and design concepts of the period, including requirements under the 1934 Field Act
- One-story massing for elementary schools; up to two-stories for junior/high schools
- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features | Buildings/Structures:

- One-story massing for elementary schools; up to two stories for middle and senior high schools
- Reinforced concrete, steel- or wood-frame construction
- Classroom wings designed for easy access and views to outdoors—with variations including L-, H-, T-shaped building plans
- Generous expanses of windows, including steel- and wood-framed multilight windows, awning and hopper casements, clerestories, and large-pane fixed windows; window groupings often mark the location of classrooms
- Stylistically more streamlined and less ornamental than 1920s period-revival styles
- Emphasis on "traditional Southern Californian" styles, such as Spanish Colonial and Mission Revival
- Styles can also include PWA Streamline Moderne, Art Deco, Late Moderne, and proto-modern styles
- May have been partially or fully funded through Works Progress Administration (WPA), 1935 to 1943
- WPA projects may include significant interior artwork such as murals, paintings and sculpture
- May have been designed by a prominent architect of the period

Character-Defining Features | Campus/District:

- Unified site plan consisting of buildings and structures designed and sited according to their use
- Use of designed outdoor and landscaped spaces, for outdoor study, recreation and dining
- Often displays connecting sheltered corridors throughout campus
- Emphasis on a more expansive site plan
- Varied collection of buildings, differentiated by function and use (rather than a single building with all functions inside)
- Might include an elaborate administration building, located near the campus entrance; administration buildings usually serve as the focal point of the campus
- Campus often composed of groupings of classroom wings, auditoriums, gymnasiums, cafeterias, and outdoor recreation and dining areas
- Middle or senior high schools might include a gymnasium designed in the style of the campus overall

Integrity Considerations:

- Should retain most of the essential physical features from the period of significance
- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable
- Schools from this period generally include buildings constructed after the period of significance, in particular post-World War II buildings, which may be non-contributing
- Eligible properties under this theme may be a single building, if it exemplifies the design ideals of the era, or a grouping (campus) of buildings constructed during the period of significance
- Intact campus groupings from the pre-1945 era are not common
- Many pre-1933 schools were substantially remodeled following the Long Beach earthquake—may retain a 1920s plan but with 1930s stylistic detailing.
- Pre-1933 schools rehabilitated post-1933 might exhibit added seismic supports of steel columns, beams, or diagonal bracing; original masonry might be covered by concrete/stucco sheathing
- Should retain integrity of Materials, Design, Workmanship, Feeling, and Association from its period of significance

Comments: Buildings exhibiting distinctive design features might also qualify under Criteria C/3, as the embodiment of the distinctive characteristics of a type/period or method of construction, as an example of the work of a master architect, or for high artistic values.

CONTEXT: PUBLIC AND PRIVATE INSTITUTIONAL DEVELOPMENT | EDUCATION
THEME: LAUSD | EARLY EXPERIMENTS IN THE MODERN, FUNCTIONALIST SCHOOL PLANT, 1933–1945

Property Type:	Institutional/Educational
Property Subtypes:	Elementary Schools, Junior High Schools, and High Schools
Period of Significance:	1933 to 1945
Area of Significance:	Education
Geographic Location:	Citywide; rare
Area of Significance:	A/1

Eligibility Standards:

- Clearly expresses the experimental ideas emerging during this period for the modern, functionalist school plant
- One-story massing for elementary schools; up to two-stories for junior/high schools
- Classrooms, in detailing and plans, clearly express their function, with axial, finger-like wings, plentiful fenestration, and connections to the outdoors
- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features | Buildings/Structures:

- One-story massing for elementary schools; up to two stories for middle and senior high schools
- Usually reinforced concrete, steel- or wood-frame construction, clad in cement/stucco
- Classrooms are often single- or double-loaded finger-like wings, arranged along a central axis or semicircle
- Classrooms open directly onto patios/play areas through glass doors or movable walls
- Varying elevations might display differentiated window sizes and configurations, in order to tailor interior light to sun patterns and create cross-lit classrooms
- Windows are plentiful and include steel- and wood-framed multilight windows, in double-hung sashes, awning and hopper casements, clerestories, and fixed panes
- Displays an informal, nonmonumental scale and spare ornamental program
- Stylistically modern; might display influence of Late Moderne or PWA Streamline Moderne
- May have been partially or fully funded through WPA, 1935 to 1943; WPA projects may include significant interior artwork such as murals, paintings and sculpture
- May have been designed by a prominent architect of the period

Character-Defining Features | Campus/District:

- A unified, nonmonumental, nonhierarchical site plan
- Displays inventive site plan incorporating buildings, landscaped courtyards, and circulation corridors into a unified campus design
- Swaths of landscaped patios and terraces adjacent to classroom wings
- Designed outdoor spaces, including patios, courtyards
- Use of outdoor corridors, with simple canopy supports and posts or *pilotis*, form links between classrooms and other buildings

Integrity Considerations:

- School expansion and new construction over the years, in particular in the postwar period, might have resulted in the addition of in-fill buildings and structures in areas that were originally designed open spaces. Such new additions should not interfere with or serve as a visual impairment to the designed connections between buildings, in particular classroom wings, and adjacent outdoor patios and spaces.
- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable
- Should retain integrity of Materials, Design, Workmanship, Feeling, and Association from its period of significance

Comments: Buildings exhibiting distinctive design features might also qualify under Criteria C/3, as the embodiment of the distinctive characteristics of a type/period or method of construction, as an example of the work of a master architect, or for high artistic values.

CONTEXT: PUBLIC AND PRIVATE INSTITUTIONAL DEVELOPMENT | EDUCATION
THEME: LAUSD | EDUCATING THE BABY BOOM: THE POSTWAR MODERN, FUNCTIONALIST SCHOOL PLANT, 1945–1969

Property Type:	Institutional/Educational
Property Subtypes:	Elementary Schools, Junior High Schools, and High Schools
Period of Significance:	1945 to 1969
Area of Significance:	Education
Geographic Location:	Citywide; with concentrations in the San Fernando Valley and west Los Angeles
Area of Significance:	A/1

Eligibility Standards:

- Clearly embodies the characteristics of a postwar modern functionalist school campus
- Displays a unified, functional site design, with buildings extending across the site and oriented in relation to outdoor spaces (courtyards, patios, outdoor play areas)
- One-story massing for elementary schools; up to two-stories for junior/high schools
- Classrooms, in detailing and plans, clearly express their function, with axial, finger-like wings, plentiful fenestration, and connections to the outdoors
- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features | Buildings/Structures:

- Building plans and site design clearly express their function; classroom wings often exhibit one-story "finger-like" wings, arranged on an axis
- Easily identifiable indoor-outdoor spaces, connections to classrooms through the incorporation of patios, courtyards, and outdoor canopied corridors
- One-story massing, particularly for elementary schools; up to two to three stories for junior and high schools
- Building types and plans expressive of postwar ideals in school design; these can include (1) finger-plan schools (usually in 1940s through 1950s); (2) cluster-plan schools (beginning in 1950s); and (3) variations and combinations of these typologies clearly expressive of the ideals for informality, indoor-outdoor connections, and zoned planning for the site
- Varying elevations might display differentiated window sizes and configurations, in order to tailor interior light to sun patterns and create cross-lit classrooms

Character-Defining Features | Campus/District:

- Unified campus design includes most or all of the following attributes: lack of formality and monumentality; low massing (usually one stories for classrooms and up to two stories for auditoriums/multipurpose rooms); strong geometric ordering of buildings and outdoor spaces; decentralized, pavilion-like layout; rational, function-driven site design; buildings extend across the site; buildings are oriented to outdoor spaces (courtyards, patios, outdoor areas), purposeful indoor-outdoor integration
- Automobile traffic/drop-off areas separated from campus; linked to interior via extended canopied corridors
- Buildings often turn inward, toward green spaces and courtyards, lawns
- Outdoor corridors, sheltered beneath simple canopies, forming links between the buildings of the campus
- Classrooms often consist of a series of axial, modular units
- An informal, domestic scale for the buildings and campus might be especially evident in elementary schools
- Swaths of patios, terraces, and plantings adjacent to and alternating with buildings
- Generous expanses of windows, including steel- and wood-framed multilight windows, in awning and hopper casements, clerestories, and fixed panes
- Flat roof or broken-plane roof often used for lighting and acoustical issues
- Modular design, with a rhythmic, asymmetrical but balanced composition
- Usually displays a modern design idiom, usually either regional modernist (with use of native materials such as stone, brick, and wood siding and/or framing), International Style modernist, or, by the early 1960s, Late Modern (more expressive and sculptural)
- Some examples might include some degree of historicist detailing or styles popular in the postwar period (such as American Colonial Revival); these are less common than modernist examples
- May have been designed by a prominent architect of the period
- Often associated with post–World War II suburbanization and growth near major employment centers beyond the city periphery (such as the San Fernando Valley and southwest Los Angeles)
- Often built in residential neighborhoods on large expanses of land, with swaths of land devoted to landscape design and playing fields (in particular for high school campuses)

Integrity Considerations:

- Retains most of the essential physical features from the period of significance
- School expansion and new construction over the years, in particular in the postwar period, might have resulted in the addition of in-fill buildings and structures in areas that were originally designed open spaces. Such new additions should not interfere with or serve as a visual impairment to the designed connections between buildings, in particular classroom wings, and adjacent outdoor patios and spaces.
- Many postwar schools were designed to be easily expandable as enrollment increased; the original site design and building types and plans should be readily discernible. If additional wings were added or the campus extended, the additions should be compatible with and visually subordinate to the original.
- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable
- Should retain integrity of Setting, Materials, Design, Workmanship, Feeling, and Association from its period of significance
- Addition of portable or permanent buildings after the period of significance acceptable as long as original campus design is intact

Comments: This theme would most often apply to a campus evaluated as a historic district. Individual buildings and/or campuses exhibiting distinctive design features might also qualify under Criteria C/3, as the embodiment of the distinctive characteristics of a type/period or method of construction, as an example of the work of a master architect, or for high artistic values.

CONTEXT: PUBLIC AND PRIVATE INSTITUTIONAL DEVELOPMENT | EDUCATION
THEME: LAUSD AND THE CIVIL RIGHTS MOVEMENT, 1954–1980

Property Type:	Institutional/Educational
Property Subtypes:	Elementary Schools, Junior High Schools, and High Schools
Period of Significance:	1954 to 1980
Area of Significance:	Education/Ethnic Heritage
Geographic Location:	Citywide
Area of Significance:	A/1 and/or B/2

Eligibility Standards:

- Was constructed during the theme of significance
- Was the site of significant integration initiatives, challenges, or activities related to the Civil Rights Movement and school integration
- Directly reflects the movement for equal access to schools and/or to employment opportunities in LAUSD schools
- Has a well-established, long-term association with a figure who was significant in the Civil Rights Movement and school integration (eligibility under B/2)

Character-Defining Features:

- Retains most of the associative and character-defining features from the period of significance

Integrity Considerations:

- Retains integrity of Location, Design, Setting, Feeling, Association
- Some materials may have been removed or altered
- If there are multiple buildings on campus constructed during the period of significance, these should be evaluated as a potential historic district

SECTION VI CONCLUSION | RECOMMENDATIONS

LAUSD is the second largest public school system in the United States and encompasses nearly 800 campuses distributed across more than 700 miles. Since its founding in 1872, the district has commissioned, designed, and acquired a remarkable collection of buildings, campuses, and facilities. These properties reflect more than a century of social, architectural, and technological advances, as well as ongoing educational and curricular reform. Extant properties range from a few late-nineteenth-century, wood-framed schoolhouses to mid-twentieth-century superblock campuses exemplary of modernist architectural design.

This Historic Context Statement represents a first step in creating a framework for context-driven evaluations of educational facilities in Los Angeles (and beyond). As LAUSD begins planning for campus-wide redevelopment and modernization under Measure Q, to be launched in 2014, this study provides a guide for conducting evaluations of LAUSD's many historically significant buildings and campuses.

Through research conducted for this study, four distinct periods emerged: (1) Founding Years, 1870s through 1909; (2) Progressive Education Movement: Standardization and Expansion, 1910 to 1933; (3) Era of Reform: Great Depression, Earthquake, and Early Experiments in the Modern, Functionalist School Plant, 1933 to 1944; and (4) Educating the Baby Boom: Postwar Expansion and the Modern, Functionalist School Plant, 1945 to 1969. Specific themes of significance associated with each era were prepared for this study, along with eligibility standards, character-defining features, and integrity thresholds for each.

Given the project need and parameters, this study focused on the potential eligibility of school buildings and campuses under Criteria A/1, as outstanding examples of LAUSD design ideals and principles, according to the era under consideration. Because the postwar era largely fell outside the scope of 2002 survey work, and postwar schools will be the focus of much of the modernization work for LAUSD in the coming years, the postwar era was explored in detail in the present study.

In addition, by identifying the character-defining features that lend campuses historic significance, this study also establishes a framework for the development of district-wide design guidelines. The guidelines are being prepared by Sapphos Environmental, Inc. to be included in environmental compliance documentation currently being prepared by LAUSD.

Recommendations | Areas for Further Research

Additional research on areas and topics beyond the current scope would further broaden the framework for evaluating significant events, people, and the architectural legacy of LAUSD. Recommendations related to the Historic Context Statement and historic resources survey are as follows:

1. **Expand the LAUSD Historic Context Statement and Historic Resources Survey to include the period to 1980**
   Pursuant to Measure Q, district-wide modernization and redevelopment will unfold gradually, over many years. Broadening the LAUSD Historic Context Statement and survey to consider all schools constructed in the past 35 years (rather than 45 years) would allow the district to take proactive steps to identify historically significant campuses (and therefore historic resources under CEQA) prior to redevelopment planning and work. This would also bring the LAUSD Comprehensive Historic Resources Survey up to date with the City of Los Angeles Office of Historic Resources citywide survey, SurveyLA.

2. **Conduct additional archival research to expand property eligibility under additional criteria**
   In the current scope, campus-specific work included research on events, patterns of development, and significant people associated with the schools included in the accompanying survey. However, project limitations precluded extensive research on LAUSD's history that might result in eligibility under Criteria A/1 (such as LAUSD and the Civil Rights Movement) and Criteria B/2 (for an association with significant figures in the history of public schools in Los Angeles). These areas represent excellent areas for further study. (The context of the Civil Rights Movement and Los Angeles schools was addressed, however, in the National Register of Historic Places Multiple Property Documentation form for African-Americans in Los Angeles.[180])

3. **Expand study of school plant property types and subtypes**
   As a general framework, this treated senior high, middle, and elementary schools, as well as other LAUSD educational facilities, with a broad brush, as a single property type. Noteworthy distinctions, generally in scale and massing, were noted throughout the context. Should subsequent survey work reveal significant distinctions among educational property types, these differences could be incorporated into an updated Historic Context Statement.

4. Update and expand the LAUSD Historic Resources Survey

Sapphos Environmental, Inc. also recommends that LAUSD take proactive steps to update its comprehensive historic resources survey, in order to consider all as-yet unevaluated LAUSD assets. With planning for district-wide modernization work under way, it will be critical that the LAUSD survey be comprehensively updated.

The survey could be initially broadened to include all post-1945 school buildings and campuses that have not yet been subject to context-driven evaluation. According to the *Los Angeles Unified School District History of Schools, 1855 to 1972*, this includes roughly 175 campuses constructed between 1955 and 1969, as well as approximately 125 campuses constructed between 1945 and 1954.[181] (The current scope with Sapphos Environmental, Inc. covers 55 campuses.)

A comprehensive survey update would help streamline and guide district-wide redevelopment plans and help LAUSD in its continuing stewardship of its many historically significant school buildings and campuses.

2. Local criteria were not included in this study. Under the provisions of California State Government Code, Section 53094, the properties of California school districts, including LAUSD, are statutorily exempt from most provisions of local ordinances, including landmark designation. California State Government Code, Section 53094 permits "the governing board of a school district, by vote of two-thirds of its members . . . [to] render a city or county zoning ordinance inapplicable to a proposed use of property by such school district . . . ." The legislative history of Section 53094 indicates that "the Legislature deliberately accorded different treatment to school districts than to other local agencies because it was well aware that school construction was subject to almost complete control by the state. . . . The Legislature accordingly provided in section 53094 that school districts, as opposed to other local agencies, should retain the right to exempt themselves from local zoning ordinances (*Santa Clara, supra*, 22 Cal.App.3d at p. 158 fn. 3.)," Court of Appeal, State of California, Second Appellate District, Division 7, *Los Angeles Unified School District, Petitioner and Appellant, v. City of Maywood, et al.*, Respondents and Defendants, Nos. B238629, B238630, Los Angeles Superior Court, filed 13 February 2013.

66. Throughout the United States, the Great Depression ushered in modern reform in many realms of architectural practice, pedagogy, and design. Two major examples in Southern California were in education and housing reform. In the early 1930s, Los Angeles's only collegiate school of architecture at USC shed its Beaux-Arts influenced curriculum and launched a modern curriculum. USC's design philosophy emphasized the same qualities advocated by school plant reformers: functional, modern design, thoughtful, integrated site planning, and indoor-outdoor integration as the key for the "good life." See Howell-Ardila, "Writing Our Own Program." In terms of housing reform, the Garden Apartment movement also emphasized these qualities as the key to providing better housing and living conditions for all. These movements shared practitioners and proponents, as well as the conviction that "modern" architecture was as much a social movement as it was an aesthetic one. For an outstanding history of the Garden Apartment movement in Los Angeles, see Architectural Resources Group, Inc., *Garden Apartments of Los Angeles Historic Context Statement*, prepared for the Los Angeles Conservancy (Los Angeles, CA, October 2012). Throughout the United States in the 1930s, these ideas occasioned a major shift in the national conversation about modern architecture.

115. If the finger-plan school remained the dominant trend for so long in spite of these shortcomings, it is in large part because the plan represented the perfect counterpoint to what reformers were still reacting against: the institutional "big block schools with internal corridors and windowless classrooms" (Gibson, *California School Buildings*, 1) These words came from the California Department of Education in 1965, long after the battle against the late-nineteenth-century big-block school had already been won. It is noteworthy that, even as late as 1965, the specter of the unfriendly, institutional school still provided the antithesis against which new ideas were measured.

Memorandum

TO: Gwenn Godek, Contract Professional/CEQA Project Manager, Los Angeles Unified School District (LAUSD)

DATE: June 28, 2016

FROM: Margarita Jerabek, Ph.D., Director of Historic Resources, Amanda Kainer, M.S., Senior Architectural Historian

RE: **PRELIMINARY HISTORIC RESOURCE EVALUATION REPORT (HRE) FOR JOHN H. FRANCIS POLYTECHNIC HIGH SCHOOL, 12431 ROSCOE BOULEVARD, SUN VALLEY, CALIFORNIA, 91352**

INTRODUCTION

PCR Services Corporation (PCR) appreciates the opportunity to prepare a Preliminary Historic Resource Evaluation Report ("HRE") for John H. Francis Polytechnic High School ("Poly HS") located at 12431 Roscoe Boulevard in Sun Valley, Los Angeles, California. Constructed between 1956 and 1957, Poly HS is older than forty-five years, and therefore meets the age threshold for consideration as a historical resource under CEQA. PCR's Historic Resources Division conducted an intensive pedestrian survey, research and evaluation of Poly HS in November 2015 to January 2016. This HRE includes a discussion of the methodology used, a brief historic context, description of existing conditions, and a significance evaluation of the subject property.

PROPERTY DESCRIPTION

Located in Sun Valley, California, in the San Fernando Valley region of the City of Los Angeles, the legal description of the subject property is Assessor's ID Number 2634-019-900, Tract #19166, Lot 1. The irregularly shaped subject property is approximately 37.20 acres and improved with a multiple-building school campus, originally built as a high school between 1956 and 1957. At the northern corner of the parcel is the Lewis Continuation High School built in 1994. The subject parcel is bounded by Sharp Avenue to the northeast, Peoria Street to the southeast, Arleta Avenue to the southwest, and Wicks Street to the northwest. The neighborhood around the school is primarily comprised of modest single-family homes, with commercial buildings sited along Roscoe Boulevard.

METHODOLOGY

The HRE was conducted by PCR's Historic Resources Division personnel Margarita Jerabek, Ph.D., Director of Historic Resources, and Amanda Y. Kainer, M.S., Senior Architectural Historian, who meet and exceed the Secretary of the Interior's Professional Qualification

Standards in history and architectural history.[1] Professional qualifications are provided in Attachment C of this HRE.

The following tasks were performed by PCR for the study:

- A pedestrian survey and digital photography was undertaken to document the existing conditions of the subject property. PCR utilized the survey methodology of the State Office of Historic Preservation ("OHP").

- Conducted site-specific research on the school sites utilizing Sanborn Fire Insurance Maps, historical photographs and plans, California Index, Avery Index, Online Archive of California, USC Digital Collections, historical *Los Angeles Times*, American Institute of Architects ("AIA") historical directory, and other published sources.

- Reviewed and applied methodology, eligibility standards and integrity considerations presented in the LAUSD Historic Context Statement.[2]

- Reviewed and analyzed ordinances, statutes, regulations, bulletins, and technical materials relating to federal, state, and local historic preservation, designation assessment processes, and related programs.

- Conducted a preliminary evaluation of the potential historic resource based upon criteria used by the National Register of Historic Places ("National Register") and California Register of Historical Resources ("California Register").

- The results of this evaluation were recorded on a Department of Parks and Recreation ("DPR") form, provided in Attachment A.

PREVIOUS EVALUATIONS

Poly HS was recommended ineligible during the 2013/2014 LAUSD Historic Resources Survey conducted by Sapphos Environmental, Inc. and assigned a California Historical Resources ("CHR") Status Code status of 6Z. The evaluation stated:

> Campus plan and buildings have many of the typical character-defining features of postwar LAUSD schools. However, taken as a whole, the campus is a common but not

[1] The Professional Qualification Standards are requirements used by the National Park Service and have been published in the Code of Federal Regulations ("CFR"), 36 CFR Part 61.

[2] Sapphos Environmental, Inc., *Los Angeles Unified School District: Historic Context Statement, 1870 to 1969* (March 2014).

outstanding exemplification of postwar LAUSD design ideas. In terms of eligibility under Criteria A/1, research did not show that this campus was the site of a significant event or representative of a significant pattern of development. In terms of eligibility under Criteria B/2, research did not show that the campus was associated with a person of significance in the community, state, or nation. In terms of eligibility under Criteria C/3, the campus and its buildings are not an outstanding or distinctive example of architectural design or the work of a master architect.[3]

In August 2015, SurveyLA (the City of Los Angeles Office of Historic Resources citywide survey) found Polytechnic High School eligible under Criteria A/1 and C/3 for federal, state, and local landmark listing as a historic district.4 SurveyLA recommended the school eligible as an "Excellent example of a post-World War II Los Angeles Unified School District high school campus, reflecting LAUSD school planning and design concepts of the postwar period and the increase in facilities to accommodate postwar growth in the San Fernando Valley."5 The SurveyLA evaluation was conducted from the public right-of-way and limited research was conducted. The SurveyLA records form for Poly HS is provided in Attachment A.

The current intensive-level evaluation, conducted from on-campus, concurs with the 2014 finding of ineligibility by Sapphos Environmental, Inc. Polytechnic HS exhibits a number of character-defining features typical of the postwar indoor-outdoor school plant, as described in the "LAUSD Historic Context Statement, 1870-1969." As assessed from on campus, however, the buildings and site plan overall do not exhibit the scale, character, or cohesiveness of the best examples of schools from the era and do not meet the eligibility standards outlined in the "LAUSD Historic Context Statement, 1870-1969." In addition, the campus does not appear to be a distinctive or outstanding example of its type or style and does not appear to be a notable example of Austin, Field, and Fry's work. Research to date has not yet revealed a potential association with a significant individual of importance to the nation, region, state, or city. Therefore, because the current evaluation was conducted from on-campus and additional research was undertaken to document the construction history using newspaper databases and historic architectural drawings, PCR agrees with the 2014 finding of ineligibility by Sapphos Environmental, Inc.

HISTORIC OVERVIEW

Educating the Baby Boom-The Postwar Modern, Functionalist School Plant (1945-1969)

At the close of World War II, the United States entered a period of unprecedented growth, with booms to both the economy and the population. This sudden shift from the austerity of the Great Depression and the war years into a period of great prosperity meant that demand far outstripped supply for most commodities and services, including that of public schools. This was especially true in California, which experienced not only the baby boom but an influx of new residents coming in from other states for jobs in California's various industries.[6]

In the 1950s, the population of the West San Fernando Valley was growing with extreme rapidity. The communities of Sun Valley, Northridge, Reseda, and Tarzana proved especially problematic in terms of providing adequate public school facilities for the ever-increasing number of families moving into the area. The population of these three communities exploded in a very short period, from about 32,000 in 1950 to over 80,000 by 1954. This massive increase in population resulted in numerous building projects carried out in the area by LAUSD, including the construction of a new campus for Poly HS (Figure 1) in the San Fernando Valley between 1955 and 1957, with its official opening in February 1957. Poly HS was established in 1905, with its original campus located at the corner of Washington Boulevard and Flower Street in downtown Los Angeles.[7] Poly HS moved from its former site in 1935, and the school was renamed from Polytechnic High School to John H. Francis Polytechnic High School in honor of the school's founder and first principle.[8]

[6] Sapphos Environmental, Inc., *Los Angeles Unified School District: Historic Context Statement, 1870 to 1969* (March 2014): 71.

[7] Poly HS originally opened in 1897 as a commercial branch of Los Angeles High School, the only high school at the time in LA. This campus was located on South Beaudry Avenue in Los Angeles. In 1905, the school moved to the corner of Washington Boulevard and Flower Street, also in downtown Los Angeles.

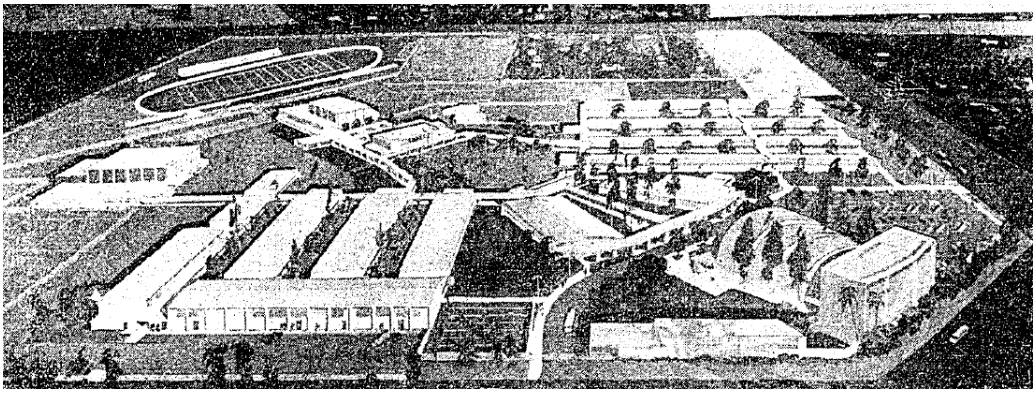

Figure 1. Rendering of Poly HS Published in the *Los Angeles Times*, 1955
("Great New School," *Los Angeles Times* (January 2, 1955): F1.)

Modern architecture came to dominate public school buildings constructed during this period, both in California and across the United States. The primary consideration in school design became function rather than style, with architects largely rejecting the historicist, hierarchical design elements that had traditionally held sway. Emphasis shifted to the experience of the pupil, and architects attempted to provide environments appropriate to the age of the student. Therefore, decentralization, informality, easy outdoor access and smaller scale prevailed. Indoor-outdoor integration of space, once considered experimental, became a staple of school design, especially in California where the climate was suited to year-round indoor-outdoor living. Modular, prefabricated design made schools more affordable and supported the design sensibilities of the period.[9]

Two new school site plan typologies emerged in the 1940s and 1950s, the finger-plan and the cluster-plan. The finger-plan actually originated in the late 1930s, but was not fully embraced until after the end of World War II. The basic concept of this type of site plan was a layout that resembled a tree trunk with branches extending out on either side. This type of plan relied upon standardized classrooms, all with the same (preferably north) orientation, and was popular for both its flexibility and expandability. However, the design could also be difficult to adapt to different topographies, required large amounts of land, and tended to increase time spent traveling from one part of the school to another. Therefore, in the 1950s, the cluster-plan school emerged as a more universally usable and cost-effective option. Cluster-plan schools were oriented around a central courtyard, rather than along an axis. The experience of the school was therefore more communal and could also be built on smaller and more topographically

[9] Sapphos Environmental, Inc., *Los Angeles Unified School District: Historic Context Statement, 1870 to 1969* (March 2014): 73-81.

varied lots. Furthermore, the plan allowed for more shared spaces and easier supervision of students. Many schools were also designed as hybrids of these two popular plans.[10]

Poly HS Construction History

The initial plans for Poly HS were drawn between 1955 and 1957 by the architecture firm of Austin, Field and Fry and landscape architect Clifford G. Schoen.[11] There are five sets of drawings archived in the LAUSD drawing archive covering the intial design of the campus spanning the period of May 1955 to December 1957. On January 2, 1955 the *Los Angeles Times* announced the first phase of the project was under construction and included an architectural rendering (Figure 1) of the proposed school.[12] The article stated the first phase of the project would house 1,000 students, with the ultimate school capacity being 2,500 students, and cost approximately $2,500,000. Two years later, the school construction was published again in the *Los Angeles Times* on May 12, 1957 claiming all of the "administrative and classroom buildings in the $5,000,000 project have been completed and the only structure yet to be finished is the auditorium….funds for the new school were obtained from $233,000,000 Los Angeles city school bond issues approved in two elections over the past five years."[13] The architectural sketch of the school accompanying this article is presented in Figure 2.

[13] "Sun Valley Project," *Los Angeles Times* (May 12, 1957): F1.

As discussed in the previous paragraph, there appears to be phases of design work covered in five sets of architectural plans. The first design phase covered in the architectural set dated May 13, 1955 included the overall layout of the campus and the plans, elevations, and sections for the Administration, Music, Homemaking, Art, Industrial Arts, Science, Agriculture, Cafeteria, Bookstore and two Classroom Buildings.[14] The spatial layouts for the site plans for the future were indicated on the plot plans. The layout of the school was known as "campus type," where all buildings are one-story and open to outdoor hallways, and the plan was a combination of both the cluster plan and finger plan types.

The second set of plans dated January 16, 1956 provides drawings for the Boys Gymnasium and Girl's Gymnasium located in the north and northwest portions of the campus.[15] In September of 1956 two sets of drawings were produced. A set of drawings dated September 1, 1956 included the specifications for the rows of classroom buildings and Library located to the east and west of the Administration Building.[16] This set of plans also included landscape designs by Clifford F. Schoen. Also, in 1956 a plan set was produced for the temporary buildings constructed to the west of the agricultural area. These buildings would later be replaced by a two-story classroom building built in 2005.[17] Finally, in 1957 a set of drawings provide the specification for the Auditorium buildings added at the southern portion of the campus.[18] Upon completion of Poly HS, it was featured in an architectural exhibit of Austin, Field, and Fry's "buildings of special historical and architectural interest" hosted at the Building Center at 7933 W 3rd Street, Los Angeles in April of 1958.[19]

It appears that the school campus has undergone very few major alterations since its initial construction. In 1968, Classroom Building 39/N was added in 1968. A number of repairs were made to the Administration Building (Building 9) following a fire as specified in a November 1982 plan set.[20] After the Northridge earthquake of 1994, repair of earthquake damage to various buildings, arcade, playground and parking was conducted.[21] The windows

were replaced in the Cafeteria building to include new serving windows and coiling counter doors in 1996.[22] To the north of Building 5 and north of Building 46 (Boy's Gymnasium) portable units were added in 1962, 1972, 1997 and 2000.

Architecture Firm of Austin, Field and Fry

The architectural and engineering firm of Austin, Field, and Fry were the architects of the Poly HS. The firm was comprised of John Corneby Wilson Austin (1870-1963), Robert Alexander Field, Jr. (1902-1984), and Charles Eugene Fry (1906 -1998) was established in Los Angeles in 1946.[23]

The firm's founding principal, John Corneby Wilson Austin (1870-1963), was born in Oxfordshire, England, educated at English schools, and apprenticed under the architect William Sampson Barwick. He immigrated to the United States from England in 1888. For three years, he lived in San Francisco, until 1895 when he moved to Los Angeles where he became a renowned architect and community leader. He is known to have worked briefly for the firm of Morgan and Walls before opening his own office. He worked alone and in partnership with Chauncey F. Skilling, W.C. Pennell, Frederick M. Ashley, and after the Second World War with Robert Field and Charles Fry. He was president of the first State Planning Board, member of the State Board of Architectural Examiners, president and on the board of directors of the Chamber of Commerce, member of the Royal Society of Arts in Great Britain, and fellow of the American Institute of Architects. John C. Austin died in Los Angeles on September 3, 1963.

John C. Austin, a master architect of his period, specialized in the design of large-scale civic, educational, and ecclesiastical architecture that followed the trends in architecture. He is known as one of the most important architects practicing in the Los Angeles and Southern California region during the first quarter of the 20th century. A consummate professional and interpreter of several architectural styles, Austin pledged no allegiance to any particular style. As his architectural career spanned approximately 68 years, he adapted his designs to the changing styles and attitudes in architecture. His extant ecclesiastical projects include the Gothic Revival Holliston Avenue United Methodist Church (ca. 1899), located at the northwest corner of Holliston Avenue and Colorado Boulevard, Pasadena; the shingled Gothic Grace Methodist

Episcopal Church (ca. 1906) at 200 N. Saint Louis Avenue, Boyle Heights; and he collaborated with A. M. Edelman, and G. Albert Lansburgh in the design of the Moorish Revival style Shrine Auditorium, also known as the Al Malaikah Temple at 665 W Jefferson Boulevard, Los Angeles (ca. 1920-26).[24]

John C. Austin's civic projects include the Griffith Park Observatory and Planetarium (ca. 1935), and Pico Gardens Public Housing (ca. 1941-42). His educational projects include the Frank Wiggins Trade School, Los Angeles High School, Monrovia High School (ca. 1928), the Administration Building at Hamilton High School (ca. 1931), the Administration Building at John Muir Middle School (ca. 1922), Venice High School (ca. 1913-1914), Walter Reed Middle School (1939), San Fernando Middle School (ca. 1916), and the Florence Nightingale Junior High School (ca. 1937-1939). Austin was associated with Frederic Morse Ashley (1870-1960), his partner in the firm Austin and Ashley, Architects, between 1929 and 1935.[25]

Following World War II, John C. Austin formed Austin, Field & Fry, an architecture and engineering firm, with Robert Field and Charles Fry in 1946.[26] Robert Field (1902-1984) was born in Chicago, Illinois in 1902, later attended Manual Art High School, Los Angeles, and graduated from University of Southern California in 1940. Charles Eugene Fry (1906-1996) was born in Los Angeles in 1906 and later attended Manual Art High School and received his B.S. in architecture at University of Southern California. In 1930, he began an apprenticeship with John C. Austin and F.M. Ashley, Architects as an Architectural Draftsman until World War II. During World War II he was in charge of airport design, construction, repairs and utilities for the United States Army Air Corps and obtained the rank of Colonel.

With their office headquartered at 2311 West 3rd Street, Austin, Field, and Fry planned and designed large-scale institutional and commercial projects including hospitals, industrial and business centers, and schools throughout Southern California. Notable projects include St. Vincent's Hospital (original 1927, additions in 1952, 1956); Superior Court of California, County of Los Angeles, Courthouse #4 (1958); California Electric Power Company (1958); First Federal Savings and Loan Association of Hollywood (1959); Western and Southern Life Insurance

Company (1960); Thiokol Chemical Corporation (1960); Shell Development Company (initial 1957, second unit 1962); and Josten Manufacturing Plant (1957).[27]

The firm specialized in the design and master planning of school campuses, elementary schools to colleges. A *Los Angeles Times* article reporting on the design of Torrance High School on July 23, 1961, noted the firm "has planned, design and engineered more than 75 major facilities at high schools and grammar schools throughout Southern California."[28] Notably they designed four buildings at the University of California, Los Angeles between 1948 and 1959, including Dodd Hall (1948), Campbell Hall (1954), Humanities Building (Rolfe Hall)(1956), and Faculty Center (1959). The design of the Humanities Building won an award citation award in the education category of an architectural design competition sponsored by *Progressive Architecture*, a national architectural magazine.[29] Other educational project include Highland Oaks School, Arcadia (1949);[30] Compton College (1953, and subsequent additions); Hugo Reid Elementary School, Arcadia (1956)[31]; Otis Art Institute (1957); Newhall Elementary School, Newhall (ca. 1959)[32]; Arcadia Unified School District's administration building (ca. 1961)[33]; Torrance High School (ca. 191)[34]; redevelopment of Mt. San Antonio College (1963)[35]; and Alhambra High School (1964) ; Suva and La Merced for the Montebello Unified School District (ca. 1973)[36] Within LAUSD, it appears Austin, Field and Fry designed a classroom building at Hamilton High School (ca. 1957) and Carson Senior High School (1969).

ARCHITECTURAL DESCRIPTION

Poly HS is sited on a 37.20-acres irregular-shaped lot, almost a polygon, improved with Mid-Century Modern style one-story campus type classroom buildings, an auditorium, cafeteria, library, and a boys and girls gymnasium. The rear of the property is improved with athletic fields, asphalt playgrounds, and tennis courts. The site plan turns inward on itself with permanent school buildings arranged in a combination cluster- and finger-plan within the southern portion of the lot. The buildings are grouped by function and are connected by

canopies to form a unified plan. Designed in the Postwar Modern style, Poly HS expresses the character-defining features of the style through its unified campus design, combination cluster- and finger-plan, low massing, flat roofs, outdoor corridors, courtyards, covered walkways, central quad, and modern materials. A current site plan with the building numbers is included in Figure 3 below.

Overall the permanent buildings are designed in the Postwar Modern style and are one-story (except for the Boy's Gymnasium (Building 46), Girl's Gymnasium (Building 45), Cafeteria (Building 23), Auditorium (Building 1), Building 4, Building 5, and Building 59). The buildings are characterized by concrete foundations, wood-frame construction, rectangular massing and plans, veneered brick and stucco wall finishes, metal sun louvres, and simplified volumes. Design emphasis is placed on maximizing the relationship of the building interiors to the outdoors, thus the buildings have multiple windows for natural light and open out onto outdoor courtyards. The fenestration includes fixed, awning, and double-hung wood-frame windows (alteration, windows are covered with metal security screens and some windows have been removed to accommodate AC units). The majority of doors are flat-panel doors with rectangular viewing windows (alteration, windows covered by metal security screens) with wood-frame transom windows (alteration, some of the windows are covered).

Figure 3. Current Aerial of Poly HS with Building Numbers

There are two school entrances (Figures 4 and 5) located near the southwest and southeast corners of the property at opposite ends. The entrances are connected by an access road that creates a division between the bottom southern end of the property, the more public sphere where the parking lots, auditorium and administration building are located, from the northern portion, the more private sphere, where the classroom buildings, gymnasiums and playing fields are located. Located in this southern portion are the Auditorium and building 2 flanked by two asphalt parking lots.

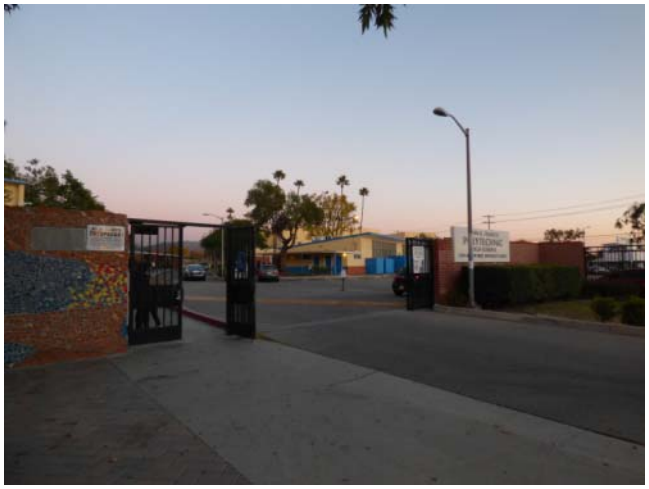

Figure 4 (Left). Southwest Entrance, View Northeast
Figure 5 (Right). Southeast Entrance, View Northwest

The Auditorium (Figures 6 and 7) is two-stories with an irregular T-shaped plan consisting of a rectangular portion for the back of the house functions connected to the main auditorium and stage. The Auditorium appears to be reinforced concrete construction with a smooth painted stucco finish. The primary (north) elevation is curved. The entrance story is veneered in brick while the heavy top story has regularly spaced vertical grooved recessed into the smooth concrete. Four pairs of flat-panel doors are recessed into the brick veneer interrupted by a central ticket window. To the west of the Auditorium is Building 2 (Figure 7) a simple building with a rectangular plan, covered by a shed roof, sheathed in stucco and brick veneer, and punctuated by awning windows, double hung windows, and flat panel doors.

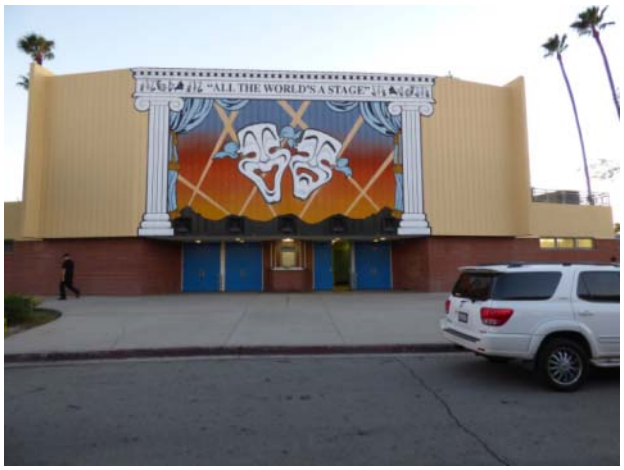

Figure 6 (Left). Auditorium and Building 2, View Southeast
Figure 7 (Right). Primary Elevation of Auditorium, View South

Located across from the auditorium building, on the north side of the access road, are the Administration and Library buildings connected by an east-west canopy supported by rectangular brick veneered piers. Situated centrally between the administration and library buildings is a north-south canopy aligned extending to the main canopy that connects all the classroom buildings. This north-south canopy along with the Auditorium, Library, Administration Building, Quad, Cafeteria, and Girl's Gymnasium are arranged along a north-south access centered in the middle of the lot.

The Administration Building (Figure 8 and 9) has a rectangular plan with a central corridor and is covered by a low-pitch front gable roof. The Administration Building is veneered in brick and has window openings on the east and west elevations covered by a deep roof overhang. Located on the north and south elevation are the entrances accessed through a pair of flat panel doors with side lights and transom windows. Located to the direct east of the administration building is the library.

The Library (Figures 10 and 11) has a T-shaped plan and is veneered in brick with entrances into the Library are located on the east elevation. The other elevations have double hung windows shielded by sun louvres and brick wing walls.

Figure 8 (Left). Administration Building, Primary Entrance on South Elevation, View Northeast
Figure 9 (Right). Side (East) Elevation and North Elevation, View Southwest

Figure 10 (Left). South and East Elevations of Library, View North West
Figure 11 (Right). East Elevation of Library, View West

The campus plan is anchored by a polygon shaped Central Quad (Figures 12 and 13). The quad is framed by covered walkways supported by slender metal posts, with the exception of the covered walkway at the north end attached to the cafeteria (Building 23), which is supported by rectangular brick veneered piers. The covered walkway is an important architectural feature that unifies the campus, provides access between buildings, defines the relationship of buildings and spaces, and provides a transition between indoor and outdoor space. At the south end of the quad is a concrete platform stage framed by an ornamental brick wall and at the north end is the Cafeteria Building 23. The Central Quad has concrete walkways stretching across the polygon at all five points and the spaces created between the walkways are planted with grass.

Figure 12 (Left). Central Quad, View South Towards Stage
Figure 13 (Right). Quad, View Northwest

Along the southeast and southwest sides of the quad are classroom buildings radiating out from the covered walkways at a forty-five-degree angle arranged in a finger plan. The southwest side has four classroom buildings (Buildings 6, 7, and 8), while the southeast side has six classroom buildings (Buildings 25, 26, 27, 28, 29, 30) arranged in three rows of two and one classroom building (Building 31) much wider with an interior hallway. Each row of classroom buildings has a sanitary building attached to the north end via a covered walkway that unites the classroom buildings and overall campus together. The classroom buildings have single-door openings, lockers, and clerestory windows shielded by sun louvres and a deep roof overhang supported by rectangular piers on the south elevations, while the opposite side is punctuated with double-hung wood-frame windows. The classrooms are sheathed with stucco and brick veneer and covered by flat roofs, except for Building 31 that has a front-gable roof and is completely veneered in brick. Representative photographs of the classroom buildings are provided in Figures 14 to 17 below. Classroom Buildings 6, 7 and 8 are protected from the street by two-story Buildings 4 and 5 (Figures 18 and 19) and are articulated with the same architectural details as the classroom buildings described above. Connected to the east elevation of Building 5 are Buildings 12 and 13.

Figure 14 (Left). South Elevation of Building 8, View Southwest
Figure 15 (Right). North Elevation of Building 7, View Southwest

Figure 16 (Left). Buildings 25 to 31, Building 31 in Forefront, View Northwest
Figure 17 (Right). Building 28, View East

Figure 18 (Left). Rear Elevations of Buildings 5 and 4, View East
Figure 19 (Right). South Elevation of Building 5, View North

Anchoring the north side of the quad is the Cafeteria. The two-story Cafeteria (Figures 20 to 23) has a rectangular plan, veneered with brick and is devoid of excess ornamentation. Attached to the south elevation is a canopy supported by large rectangular piers. The lunch shelter supported by square metal columns is attached to the west and rear (north) elevations under which there are pairs of double doors and lunch counter windows (alteration, replaced). In front of the lunch shelter is a row of three square planter boxes with trees and Building 22, the Student Store building.

Figure 20 (Left). South Elevation of Cafeteria, View North
Figure 21 (Right). View of Cafeteria, Building 22 and Girl's Gymnasium, View Northwest

Figure 22 (Left). Lunch Shelter, View Southwest
Figure 23 (Right). Underneath Lunch Shelter and West Elevation of Cafeteria, View East

Located directly behind the Cafeteria is the Girl's Gymnasium. The Girl's Gymnasium (Figures 24 to 25) has a rectangular plan and massing and is composed of at least three rectangular volumes. Veneered in brick, the primary two-story volume housing the gymnasium are onmented with concrete piers spaced at regular intervals. The rear and side elevations have awning and double-hung windows, as well as single and double flat panel doors some with transom windows.

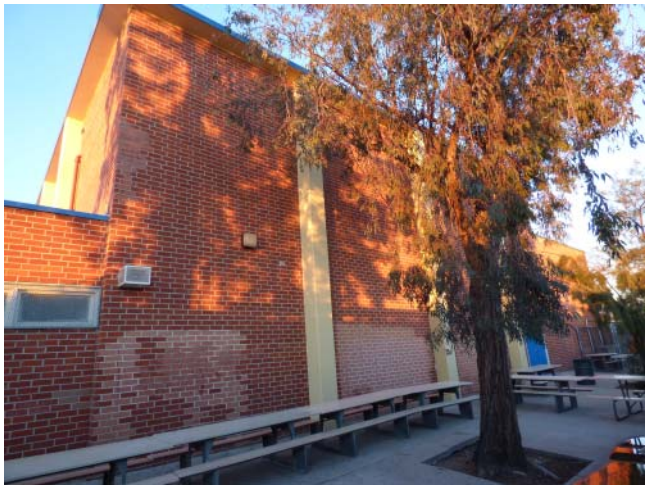

Figure 24 (Left) South Elevation of Girl's Gymnasium, View North
Figure 25 (Right). East and Elevation of Girl's Gymnasium, View Southwest

To the northeast of the quad is the one-and-two story utility building, Building 24. Veneered in brick and sheathed in stucco, Building 24 (Figure 26) has an irregular plan with a curved wall wrapping from the east to north elevations. Building 24 has louvre windows, flat panel doors, and awning and double-hung windows.

Figure 26. Utility Building, View South

The Boy's Gymnasium is located to the west of the Cafeteria and Girl's Gymnasium, has a rectangular plan, and is veneered in brick (alteration, some of the brick has been poorly patched). The Boy's gymnasium (Figures 27 and 28) is composed of four square volumes with varying heights, the tallest and largest volume containing the main gymnasium space. The gymnasium volume has concrete piers spaced at regular intervals embellishing the second floor of all four elevations. A canopy is attached to the primary elevation under which there are a

number of opening, single and double panel doors, into the various spaces. The side and rear elevations have awning and double-hung windows (alteration, covered by metal security screens).

Figure 27 (Left). Primary (South) Elevation of Boy's Gymnasium, View North
Figure 28 (Right). Side (East) and Rear (North) Elevation of Boy's Gymnasium, View Southwest

The Agricultural Area (Figures 29 to 30) is located at the southeast corner of the school site and is a rectangular parcel of land. Within the agricultural area are four simple buildings (Buildings 40, 41, 42, 43) constructed between 1956 and 1957.[37] This area is improved with many mature palm trees and planting beds.

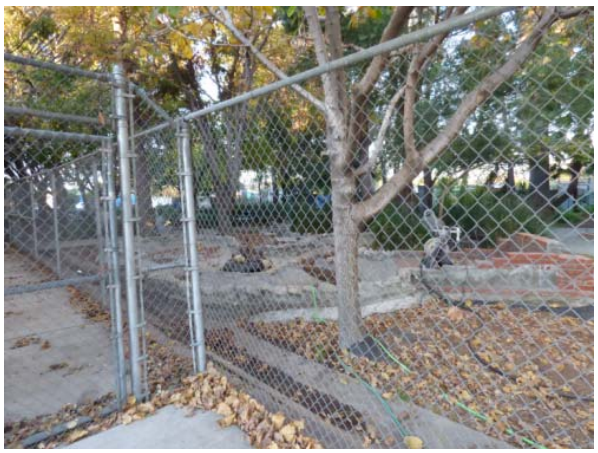

Figure 29 (Left). Agricultural Area, View Northeast
Figure 30 (Right). Agricultural Area, View Southeast

[37] PCR conducted the survey of the agricultural buildings from behind the chain link fence containing the agricultural area.

Integrity Analysis

Poly HS retains all seven aspects of integrity from its period of significance (1956-1958): location, materials, workmanship, design, setting, feeling, and association. The school occupies its original location. Regarding setting, the school retains its original setting including the landscape, canopies, relationship between the buildings and open space, and surrounding neighborhood context. The subject school expresses the Postwar Modern architectural aesthetic of simplicity of design, emphasis on the relationship of the buildings to the outdoors, geometric forms, and a unified site plan. Regarding materials, design and workmanship, Poly HS retains the majority of its character-defining buildings, features, spaces, materials, and overall plan. Alterations include the installation of metal security screens, infill of window openings with AC equipment, painting over of windows, handicap upgrades, painting over and patching of brick veneer, and replacement of the cafeteria serving windows. The overall plan of the school remains intact despite some open spaces being filled in with relocatable buildings. Despite these alterations, Poly HS retains integrity of materials, design and workmanship. Because the school has changed minimally since it was constructed between 1956 and 1958, it continues to express the aesthetic and historic feeling of a Postwar era school designed by Austin, Field and Fry and retains integrity of feeling. As a result, Poly HS conveys historical associations under the theme of Educating the Baby Boom-The Postwar Modern, Functionalist School Plant (1945-1969) developed within the LAUSD Historic Context Statement.

SIGNIFICANCE EVALUATION

Poly HS is representative of a Postwar Modern style school designed by the prominent Los Angeles architecture firm Austin, Field, and Fry. The period of significance is between 1956 and 1958, the span of time in which Poly HS was constructed. The school was evaluated against the theme of Educating the Baby Boom-The Postwar Modern, Functionalist School Plant (1945-1969) developed in the "LAUSD Historic Context Statement, 1870-1969." The subject school was evaluated within the context of this theme against the applicable national and state criteria.

In regards to the broad patterns of history, Poly HS does not reach the threshold for significance under Criterion A of the National Register or Criterion 1 of the California Register. Poly HS was constructed during a period of accelerated growth in Los Angeles. During the Postwar period, Los Angeles quickly grew outward and expanded into the San Fernando Valley where farmland was redeveloped into housing subdivisions. Because of the rapid increase in population in the San Fernando Valley, there was an increased demand for schools and as a result Poly HS was one of many new schools constructed in the San Fernando Valley during this period of accelerated growth. While Poly HS reflects a pattern of increased Postwar development resulting from the suburbanization of the San Fernando Valley, Poly HS does not appear to have made a significant contribution to the broad patterns of our history. The

construction of Poly HS was part of the larger development of the San Fernando Valley and its completion was not an important event, milestone or factor driving the Valley's popularity and exponential growth. Furthermore, it appears the design finger-plan and cluster-plan hybrid design of Poly HS did not influence the designs of other District schools, as these plan types were already established in the District by the time the construction of Poly HS in its entirety was completed in 1958.

Poly HS does not appear to satisfy National Register Criterion B or California Register Criterion 2 for eligibility related to a historic personage. Research within the *Los Angeles Times* and other databases has not identified Poly HS with the productive life of any significant individual District teachers, principals, administrators, students, or any other persons important in our past.

With regard to architecture, design or construction, Poly HS retains integrity and embodies the character-defining features of a Postwar Modern functionalist campus, such as the unified campus design, combination cluster-and finger plan, low massing, flat roofs, integration of outdoor rooms, corridors connecting buildings, central quad, and modern use of brick. While Poly HS represents the Postwar design trends for high schools, Poly HS does not appear to be a distinctive or innovative example of a Mid-Century Modern style campus. There are other more notable examples of Postwar Modern junior and high schools in the LAUSD constructed during the same period, such as Chatsworth Senior High School, Palisades Senior High School, Grover Cleveland High School, and Marina del Rey Junior High School. Furthermore, it appears there are better examples of the finger-and-cluster plan hybrid within the District, such as Sumner Spaulding and John Rex's Orville's design for Wright Middle School (originally Westchester High School) constructed between 1948 and 1952 and Roland H. Crawford's design for George K. Porter Middle High constructed in 1959. Both of these schools were designed by master architects who established architectural trends for school design and could be referred to as master architects. It appears that Austin, Field, and Fry, the architecture firm responsible for the design of Poly HS, was influenced by the Postwar designs established by other architects within the District, in addition to trends popularized in architectural journals.

While Poly HS was designed by Austin, Field and Fry, a prominent Southern California architectural firm, they were responsible for the design, planning, and engineering of over 75 educational projects throughout the firm's accomplished career. Within their overall body of work, Poly HS appears to be a representative example of their educational architecture and master planning of the mid to late 1950s, but does not appear to rise to the threshold of one of their better works. Their more notable educational projects include Compton College (1953, and subsequent additions); Otis Art Institute (1957); Mt. San Antonio College (1963); and Alhambra High School (1964); and four buildings for UCLA, Dodd Hall, Campbell Hall, Humanities Building and the Faculty Center, designed between 1948 and 1959. For the design of the Humanities

building UCLA, Austin, Field, and Fry won accolades from *Progressive Architecture*. Within the larger context of Austin, Field, and Fry's educational and institutional architecture, Poly HS does not appear to be a distinctive or notable project. Therefore, it appears Poly HS is not a notable work of the architecture firm of Austin, Field and Fry, and is not a distinctive example of a Postwar Modern functional campus. Thus, Poly HS is ineligible for listing under National Register Criterion C and California Criterion 3 for its architecture.

CONCLUSION

As a result of PCR's investigations, ESA concurs with the 2014 finding of ineligibility by Sapphos Environmental, Inc. and recommends Poly HS ineligible under National Register and California Register criteria due insufficient historical significance and architectural merit. Therefore, PCR reaffirms the previous CHR Status Code of 6Z assigned to the subject school during the 2013/2014 LAUSD Historic Resources Survey. The DPR form recording the results of these investigations is provided in Attachment B.

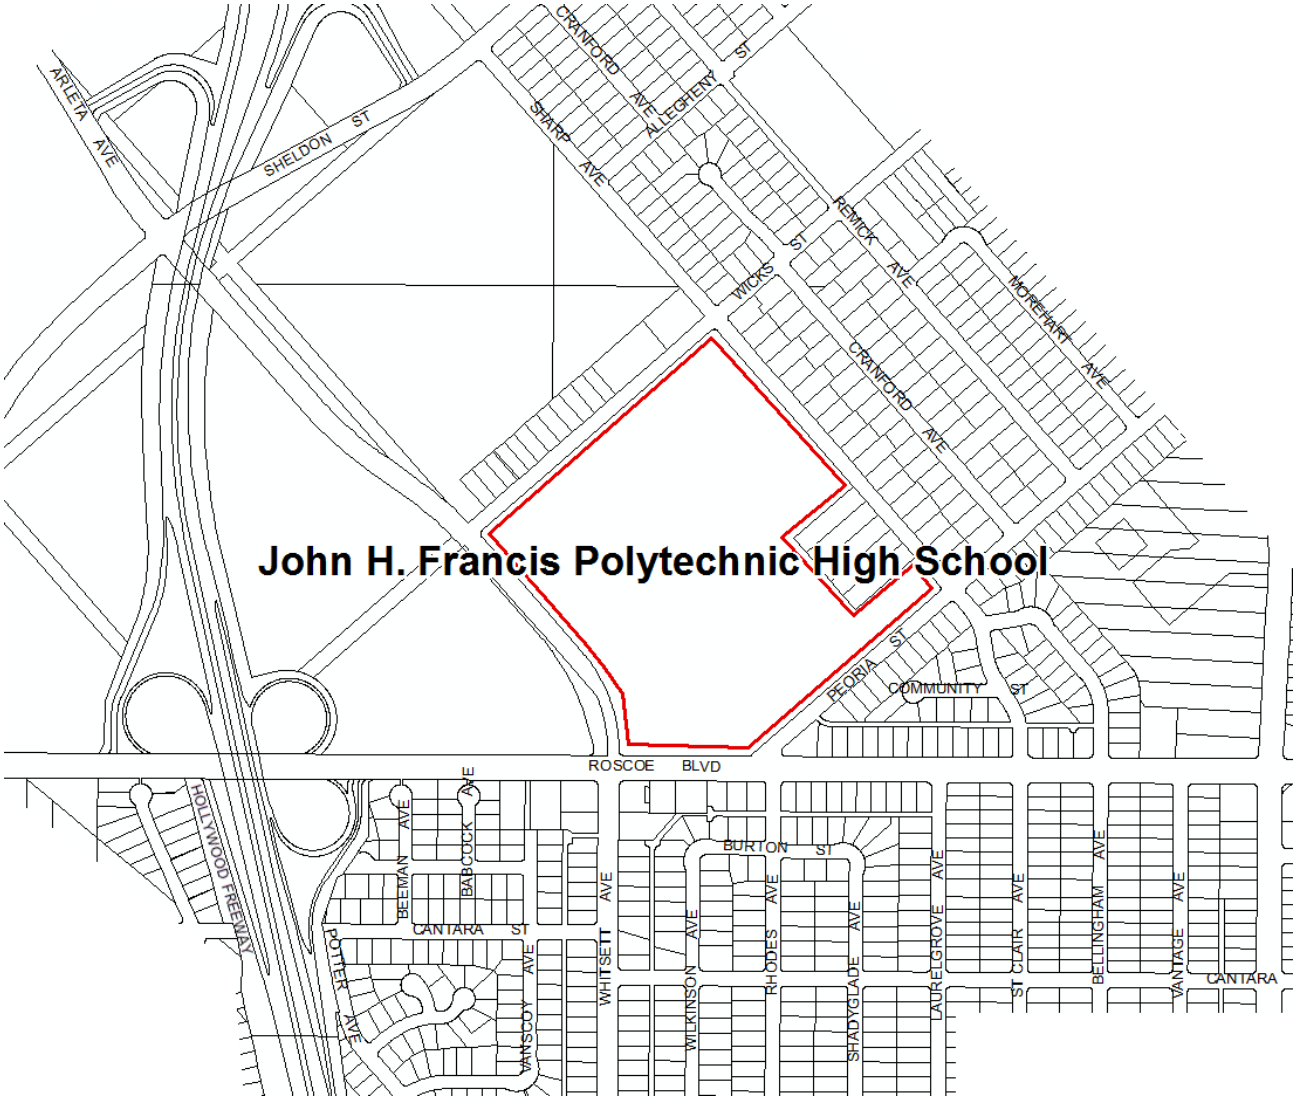
ATTACHMENT A – SURVEYLA RECORD FORM (2015)

Name: John H. Francis Polytechnic High School



Description:

Located at 12431 Roscoe Blvd. the school occupies an irregularly-shaped parcel at the intersection of Roscoe Blvd. and Arleta Ave. The campus is composed of multiple one-story classroom buildings and an auditorium building, linked by covered walkways. Designed in the Mid-Century Modern style, building features include flat and shed roofs, smooth stucco cladding, double-hung metal windows, and slab doors. Other features of the site include paved playgrounds, an athletic field, and surface parking. The property is surrounded by a high chain-link fence and mature trees.

Significance:

Excellent example of a post-World War II Los Angeles Unified School District high school campus, reflecting LAUSD school planning and design concepts of the postwar period and the increase in facilities to accommodate postwar growth in the San Fernando Valley.

Name: Laurel Canyon Mobile Estates

Description:

Mobile home park located at 9051 Laurel Canyon Blvd. The property contains multiple spaces occupied by mobile homes from various time periods, as well as a central community building, pool, and sales office. Property is not accessible to the public.

Significance:

Mobile home and trailer parks recorded for SurveyLA are those that appear to be good examples of the type as evidenced by their overall site design and planning, and inclusion of permanent features such as community buildings, swimming pools, and signage. Recorded mobile home/trailer parks may also be early examples of the type and may have evolved from earlier auto courts. However, since mobile home/trailer parks are not fully visible from the public right-of-way, more analysis is needed to assess significance and integrity. Therefore, the evaluation could not be completed.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Poly HS is sited on a 37.20-acres irregular-shaped lot, almost a polygon, improved with Mid-Century Modern style one-story campus type classroom buildings, an auditorium, cafeteria, library, and a boys and girls gymnasium. The rear of the property is improved with athletic fields, asphalt playgrounds, and tennis courts. The site plan turns inward on itself with permanent school buildings arranged in a combination cluster- and finger-plan within the southern portion of the lot. The buildings are grouped by function and are connected by canopies to form a unified plan. Designed in the Postwar Modern style, Poly HS expresses the character-defining features of the style through its unified campus design, combination cluster-and finger-plan, low massing, flat roofs, outdoor corridors, courtyards, covered walkways, central quad, and modern materials.

Overall the permanent buildings are designed in the Postwar Modern style and are one-story (except for the Boy's Gymnasium (Building 46), Girl's Gymnasium (Building 45), Cafeteria (Building 23), Auditorium (Building 1), Building 4, Building 5, and Building 59). The buildings are characterized by concrete foundations, wood-frame construction, rectangular massing and plans, veneered brick and stucco wall finishes, metal sun louvres, and simplified volumes. Design emphasis is placed on maximizing the relationship of the building interiors to the outdoors, thus the buildings have multiple windows for natural light and open out onto outdoor courtyards. The fenestration includes fixed, awning, and double-hung wood-frame windows (alteration, windows are covered with metal security screens and some windows have been removed to accommodate AC units). The majority of doors are flat-panel doors with rectangular viewing windows (alteration, windows covered by metal security screens) with wood-frame transom windows (alteration, some of the windows are covered).

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Poly HS is representative of a Postwar Modern style school designed by the prominent Los Angeles architecture firm Austin, Field, and Fry. The period of significance is between 1956 and 1958, the span of time in which Poly HS was constructed. The school was evaluated against the theme of Educating the Baby Boom-The Postwar Modern, Functionalist School Plant (1945-1969) developed in the LAUSD Historic Context Statement. The subject school was evaluated within the context of this theme against the applicable national and state criteria. As a result of PCR's investigations, Poly HS appears ineligible under National Register and California Register criteria due insufficient historical significance and architectural merit. Therefore, PCR reaffirms the previous NRHP Status Code of 6Z assigned to the subject school during the 2013/2014 LAUSD Historic Resources Survey. Greater detail is provided on the continuation sheets.

B6. Construction History

Historic Overview

At the close of World War II, the United States entered a period of unprecedented growth, with booms to both the economy and the population. This sudden shift from the austerity of the Great Depression and the war years into a period of great prosperity meant that demand far outstripped supply for most commodities and services, including that of public schools. This was especially true in California, which experienced not only the baby boom but an influx of new residents coming in from other states for jobs in California's various industries.[i]

In the 1950s, the population of the West San Fernando Valley was growing with extreme rapidity. The communities of Sun Valley, Northridge, Reseda, and Tarzana proved especially problematic in terms of providing adequate public school facilities for the ever-increasing number of families moving into the area. The population of these three communities exploded in a very short period, from about 32,000 in 1950 to over 80,000 by 1954. This massive increase in population resulted in numerous building projects carried out in the area by LAUSD, including the construction of a new campus for Poly HS (Figure 1) in the San Fernando Valley between 1955 and 1957, with its official opening in February 1957. Poly HS was established in 1905, with its original campus located at the corner of Washington Boulevard and Flower Street in downtown Los Angeles.[ii] Poly HS moved from its former site in 1935, and the school was renamed from Polytechnic High School to John H. Francis Polytechnic High School in honor of the school's founder and first principle.[iii]

Modern architecture came to dominate public school buildings constructed during this period, both in California and across the United States. The primary consideration in school design became function rather than style, with architects largely rejecting the historicist, hierarchical design elements that had traditionally held sway. Emphasis shifted to the experience of the pupil, and architects attempted to provide environments appropriate to the age of the student. Therefore, decentralization, informality, easy outdoor access and smaller scale prevailed. Indoor-outdoor integration of space, once considered experimental, became a staple of school design, especially in California where the climate was suited to year-round indoor-outdoor living. Modular, prefabricated design made schools more affordable and supported the design sensibilities of the period.[iv]

Two new school site plan typologies emerged in the 1940s and 1950s, the finger-plan and the cluster-plan. The finger-plan actually originated in the late 1930s, but was not fully embraced until after the end of World War II. The basic concept of this type of site plan was a layout that resembled a tree trunk with branches extending out on either side. This type of plan relied upon standardized classrooms, all with the same (preferably north) orientation, and was popular for both its flexibility and expandability. However, the design could also be difficult to adapt to different topographies, required large amounts of land, and tended to increase time spent traveling from one part of the school to another. Therefore, in the 1950s, the cluster-plan school emerged as a more universally usable and cost-effective option. Cluster-plan schools were oriented around a central courtyard, rather than along an axis. The experience of the school was therefore more communal and could also be built on smaller and more topographically varied lots. Furthermore, the plan allowed for more shared spaces and easier supervision of students. Many schools were also designed as hybrids of these two popular plans.[v]

Poly High Construction History

The initial plans for Poly HS were drawn between 1955 and 1957 by the architecture firm of Austin, Field and Fry and landscape architect Clifford G. Schoen.[vi] There are five sets of drawings archived in the LAUSD drawing archive covering the intial design of the campus spanning the period of May 1955 to December 1957. On January 2, 1955 the *Los Angeles Times* announced the first phase of the project was under construction and included an architectural rendering (Figure 1) of the proposed school.[vii] The article stated the first phase of the project would house 1,000 students, with the ultimate school capacity being 2,500 students, and cost approximately $2,500,000. Two years later, the school construction was published again in the *Los Angeles Times* on May 12, 1957 claiming all of the "administrative and classroom buildings in the $5,000,000 project have been completed and the only structure yet to be finished is the auditorium….funds for the new school were obtained from $233,000,000 Los Angeles city school bond issues approved in two elections over the past five years."[viii]

B6. Construction History (continued)

As discussed in the previous paragraph, there appears to be phases of design work covered in five sets of architectural plans. The first design phase covered in the architectural set dated May 13, 1955 included the overall layout of the campus and the plans, elevations, and sections for the Administration, Music, Homemaking, Art, Industrial Arts, Science, Agriculture, Cafeteria, Bookstore and two Classroom Buildings.[ix] The spatial layouts for the site plans for the future were indicated on the plot plans. The layout of the school was known as "campus type," where all buildings are one-story and open to outdoor hallways, and the plan was a combination of both the cluster plan and finger plan types.

The second set of plans dated January 16, 1956 provides drawings for the Boys Gymnasium and Girl's Gymnasium located in the north and northwest portions of the campus.[x] In September of 1956 two sets of drawings were produced. A set of drawings dated September 1, 1956 included the specifications for the rows of classroom buildings and Library located to the east and west of the Administration Building.[xi] This set of plans also included landscape designs by Clifford F. Schoen. Also, in 1956 a plan set was produced for the temporary buildings constructed to the west of the agricultural area. These buildings would later be replaced by a two-story classroom building built in 2005.[xii] Finally, in 1957 a set of drawings provide the specification for the Auditorium buildings added at the southern portion of the campus.[xiii] Upon completion of Poly HS, it was featured in an architectural exhibit of Austin, Field, and Fry's "buildings of special historical and architectural interest" hosted at the Building Center at 7933 W 3rd Street, Los Angeles in April of 1958.[xiv]

It appears that the school campus has undergone very few major alterations since its initial construction. In 1968, Classroom Building 39/N was added in 1968. A number of repairs were made to the Administration Building (Building 9) following a fire as specified in a November 1982 plan set.[xv] After the Northridge earthquake of 1994, repair of earthquake damage to various buildings, arcade, playground and parking was conducted.[xvi] The windows were replaced in the Cafeteria building to include new serving windows and coiling counter doors in 1996.[xvii] To the north of Building 5 and north of Building 46 (Boy's Gymnasium) portable units were added in 1962, 1972, 1997 and 2000.

Architecture Firm of Austin, Field and Fry

The architectural and engineering firm of Austin, Field, and Fry were the architects of the Poly HS. The firm was comprised of John Corneby Wilson Austin (1870-1963), Robert Alexander Field, Jr. (1902-1984), and Charles Eugene Fry (1906 - 1998) was established in Los Angeles in 1946.[xviii]

The firm's founding principal, John Corneby Wilson Austin (1870-1963), was born in Oxfordshire, England, educated at English schools, and apprenticed under the architect William Sampson Barwick. He immigrated to the United States from England in 1888. For three years, he lived in San Francisco, until 1895 when he moved to Los Angeles where he became a renowned architect and community leader. He is known to have worked briefly for the firm of Morgan and Walls before opening his own office. He worked alone and in partnership with Chauncey F. Skilling, W.C. Pennell, Frederick M. Ashley, and after the Second World War with Robert Field and Charles Fry. He was president of the first State Planning Board, member of the State Board of Architectural Examiners, president and on the board of directors of the Chamber of Commerce, member of the Royal Society of Arts in Great Britain, and fellow of the American Institute of Architects. John C. Austin died in Los Angeles on September 3, 1963.

John C. Austin, a master architect of his period, specialized in the design of large-scale civic, educational, and ecclesiastical architecture that followed the trends in architecture. He is known as one of the most important architects practicing in the Los Angeles and Southern California region during the first quarter of the 20th century. A consummate professional and interpreter of several architectural styles, Austin pledged no allegiance to any particular style. As his architectural career spanned approximately 68 years, he adapted his designs to the changing styles and attitudes in architecture. His extant ecclesiastical projects include the Gothic Revival Holliston Avenue United Methodist Church (ca. 1899), located at the northwest corner of Holliston Avenue and Colorado Boulevard, Pasadena; the shingled Gothic Grace Methodist Episcopal Church (ca. 1906) at 200 N. Saint Louis Avenue, Boyle Heights; and he collaborated with A. M. Edelman, and G. Albert Lansburgh in the design of the Moorish Revival style Shrine Auditorium, also known as the Al Malaikah Temple at 665 W Jefferson Boulevard, Los Angeles (ca. 1920-26).[xix]

Architecture Firm of Austin, Field and Fry (continued)

John C. Austin's civic projects include the Griffith Park Observatory and Planetarium (ca. 1935), and Pico Gardens Public Housing (ca. 1941-42). His educational projects include the Frank Wiggins Trade School, Los Angeles High School, Monrovia High School (ca. 1928), the Administration Building at Hamilton High School (ca. 1931), the Administration Building at John Muir Middle School (ca. 1922), Venice High School (ca. 1913-1914), Walter Reed Middle School (1939), San Fernando Middle School (ca. 1916), and the Florence Nightingale Junior High School (ca. 1937-1939). Austin was associated with Frederic Morse Ashley (1870-1960), his partner in the firm Austin and Ashley, Architects, between 1929 and 1935.[xx]

Following World War II, John C. Austin formed Austin, Field & Fry, an architecture and engineering firm, with Robert Field and Charles Fry in 1946.[xxi] Robert Field (1902-1984) was born in Chicago, Illinois in 1902, later attended Manual Art High School, Los Angeles, and graduated from University of Southern California in 1940. Charles Eugene Fry (1906-1996) was born in Los Angeles in 1906 and later attended Manual Art High School and received his B.S. in architecture at University of Southern California. In 1930, he began an apprenticeship with John C. Austin and F.M. Ashley, Architects as an Architectural Draftsman until World War II. During World War II he was in charge of airport design, construction, repairs and utilities for the United States Army Air Corps and obtained the rank of Colonel.

With their office headquartered at 2311 West 3rd Street, Austin, Field, and Fry planned and designed large-scale institutional and commercial projects including hospitals, industrial and business centers, and schools throughout Southern California. Notable projects include St. Vincent's Hospital (original 1927, additions in 1952, 1956); North American Aviation, Inc. (1957); Superior Court of California, County of Los Angeles, Courthouse #4 (1958); California Electric Power Company (1958); First Federal Savings and Loan Association of Hollywood (1959); Western and Southern Life Insurance Company (1960); Thiokol Chemical Corporation (1960); Shell Development Company (initial 1957, second unit 1962); and Josten Manufacturing Plant (1957).[xxii]

The firm specialized in the design and master planning of school campuses, elementary schools to colleges. A *Los Angeles Times* article reporting on the design of Torrance High School on July 23, 1961, noted the firm "has planned, design and engineered more than 75 major facilities at high schools and grammar schools throughout Southern California."[xxiii] Notably they designed four buildings at the University of California, Los Angeles between 1948 and 1959, including Dodd Hall (1948), Campbell Hall (1954), Humanities Building (Rolfe Hall)(1956), and Faculty Center (1959). The design of the Humanities Building won an award citation award in the education category of an architectural design competition sponsored by *Progressive Architecture*, a national architectural magazine.[xxiv] Other educational project include Highland Oaks School, Arcadia (1949);[xxv] Compton College (1953, and subsequent additions); Hugo Reid Elementary School, Arcadia (1956)[xxvi]; Otis Art Institute (1957); Newhall Elementary School, Newhall (ca. 1959)[xxvii]; Arcadia Unified School District's administration building (ca. 1961)[xxviii]; Torrance High School (ca. 191)[xxix]; redevelopment of Mt. San Antonio College (1963)[xxx]; and Alhambra High School (1964) ; Suva and La Merced for the Montebello Unified School District (ca. 1973)[xxxi] Within LAUSD, it appears Austin, Field and Fry designed a classroom building at Hamilton High School (ca. 1957) and Carson Senior High School (1969).

*Recorded by: PCR Services *Date: 6/28/2016 ☒ Continuation ☐ Update

P3a. Description (continued)

There are two school entrances (Figures 4 and 5) located near the southwest and southeast corners of the property at opposite ends. The entrances are connected by an access road that creates a division between the bottom southern end of the property, the more public sphere where the parking lots, auditorium and administration building are located, from the northern portion, the more private sphere, where the classroom buildings, gymnasiums and playing fields are located. Located in this southern portion are the Auditorium and building 2 flanked by two asphalt parking lots.

The Auditorium (Figures 6 and 7) is two-stories with an irregular T-shaped plan consisting of a rectangular portion for the back of the house functions connected to the main auditorium and stage. The Auditorium appears to be reinforced concrete construction with a smooth painted stucco finish. The primary (north) elevation is curved. The entrance story is veneered in brick while the heavy top story has regularly spaced vertical grooved recessed into the smooth concrete. Four pairs of flat-panel doors are recessed into the brick veneer interrupted by a central ticket window. To the west of the Auditorium is Building 2 (Figure 7) a simple building with a rectangular plan, covered by a shed roof, sheathed in stucco and brick veneer, and punctuated by awning windows, double hung windows, and flat panel doors.

Located across from the auditorium building, on the north side of the access road, are the Administration and Library buildings connected by an east-west canopy supported by rectangular brick veneered piers. Situated centrally between the administration and library buildings is a north-south canopy aligned extending to the main canopy that connects all the classroom buildings. This north-south canopy along with the Auditorium, Library, Administration Building, Quad, Cafeteria, and Girl's Gymnasium are arranged along a north-south access centered in the middle of the lot.

The Administration Building (Figure 8 and 9) has a rectangular plan with a central corridor and is covered by a low-pitch front gable roof. The Administration Building is veneered in brick and has window openings on the east and west elevations covered by a deep roof overhang. Located on the north and south elevation are the entrances accessed through a pair of flat panel doors with side lights and transom windows. Located to the direct east of the administration building is the library.

The Library (Figures 10 and 11) has a T-shaped plan and is veneered in brick with entrances into the Library are located on the east elevation. The other elevations have double hung windows shielded by sun louvres and brick wing walls.

The campus plan is anchored by a polygon shaped Central Quad (Figures 12 and 13). The quad is framed by covered walkways supported by slender metal posts, with the exception of the covered walkway at the north end attached to the cafeteria (Building 23), which is supported by rectangular brick veneered piers. The covered walkway is an important architectural feature that unifies the campus, provides access between buildings, defines the relationship of buildings and spaces, and provides a transition between indoor and outdoor space. At the south end of the quad is a concrete platform stage framed by an ornamental brick wall and at the north end is the Cafeteria Building 23. The Central Quad has concrete walkways stretching across the polygon at all five points and the spaces created between the walkways are planted with grass.

Along the southeast and southwest sides of the quad are classroom buildings radiating out from the covered walkways at a forty-five degree angle arranged in a finger plan. The southwest side has four classroom buildings (Buildings 6, 7, and 8), while the southeast side has six classroom buildings (Buildings 25, 26, 27, 28, 29, 30) arranged in three rows of two and one classroom building (Building 31) much wider with an interior hallway. Each row of classroom buildings has a sanitary building attached to the north end via a covered walkway that unites the classroom buildings and overall campus together. The classroom buildings have single-door openings, lockers, and clerestory windows shielded by sun louvres and a deep roof overhang supported by rectangular piers on the south elevations, while the opposite side is punctuated with double-hung wood-frame windows. The classrooms are sheathed with stucco and brick veneer and covered by flat roofs, except for Building 31 that has a front-gable roof and is completely veneered in brick. Representative photographs of the classroom buildings are provided in Figures 14 to 17 below. Classroom Buildings 6, 7 and 8 are protected from the street by two-story Buildings 4 and 5 (Figures 18 and 19) and are articulated with the same architectural details as the classroom buildings described above. Connected to the east elevation of Building 5 are Buildings 12 and 13.

*Recorded by: PCR Services *Date: 6/28/2016 ☒ Continuation ☐ Update

P3a. Description (continued)

Anchoring the north side of the quad is the Cafeteria. The two-story Cafeteria (Figures 20 to 23) has a rectangular plan, veneered with brick and is devoid of excess ornamentation. Attached to the south elevation is a canopy supported by large rectangular piers. The lunch shelter supported by square metal columns is attached to the west and rear (north) elevations under which there are pairs of double doors and lunch counter windows (alteration, replaced). In front of the lunch shelter is a row of three square planter boxes with trees and Building 22, the Student Store building.

Located directly behind the Cafeteria is the Girl's Gymnasium. The Girl's Gymnasium (Figures 24 to 25) has a rectangular plan and massing and is composed of at least three rectangular volumes. Veneered in brick, the primary two-story volume housing the gymnasium are onmented with concrete piers spaced at regular intervals. The rear and side elevations have awning and double-hung windows, as well as single and double flat panel doors some with transom windows.

To the northeast of the quad is the one-and-two story utility building, Building 24. Veneered in brick and sheathed in stucco, Building 24 (Figure 26) has an irregular plan with a curved wall wrapping from the east to north elevations. Building 24 has louvre windows, flat panel doors, and awning and double-hung windows.

The Boy's Gymnasium is located to the west of the Cafeteria and Girl's Gymnasium, has a rectangular plan, and is veneered in brick (alteration, some of the brick has been poorly patched). The Boy's gymnasium (Figures 27 and 28) is composed of four square volumes with varying heights, the tallest and largest volume containing the main gymnasium space. The gymnasium volume has concrete piers spaced at regular intervals embellishing the second floor of all four elevations. A canopy is attached to the primary elevation under which there are a number of opening, single and double panel doors, into the various spaces. The side and rear elevations have awning and double-hung windows (alteration, covered by metal security screens).

The Agricultural Area (Figures 29 to 30) is located at the southeast corner of the school site and is a rectangular parcel of land. Within the agricultural area are four simple buildings (Buildings 40, 41, 42, 43) constructed between 1956 and 1957. This area is improved with many mature palm trees and planting beds.

Integrity Analysis

Poly HS retains all seven aspects of integrity from its period of significance (1956-1958): location, materials, workmanship, design, setting, feeling, and association. The school occupies its original location. Regarding setting, the school retains its original setting including the landscape, canopies, relationship between the buildings and open space, and surrounding neighborhood context. The subject school expresses the Postwar Modern architectural aesthetic of simplicity of design, emphasis on the relationship of the buildings to the outdoors, geometric forms, and a unified site plan. Regarding materials, design and workmanship, Poly HS retains the majority of its character-defining buildings, features, spaces, materials, and overall plan. Alterations include the installation of metal security screens, infill of window openings with AC equipment, painting over of windows, handicap upgrades, painting over and patching of brick veneer, and replacement of the cafeteria serving windows. The overall plan of the school remains intact despite some open spaces being filled in with relocatable buildings. Despite these alterations, Poly HS retains integrity of materials, design and workmanship. Because the school has changed minimally since it was constructed between 1956 and 1958, it continues to express the aesthetic and historic feeling of a Postwar era school designed by Austin, Field and Fry and retains integrity of feeling. As a result, Poly HS conveys historical associations under the theme of Educating the Baby Boom-The Postwar Modern, Functionalist School Plant (1945-1969) developed within the LAUSD Historic Context Statement.

*Recorded by: PCR Services *Date: 6/28/2016 ☒ Continuation ☐ Update

B10. Significance (continued)

In regards to the broad patterns of history, Poly HS does not reach the threshold for significance under Criterion A of the National Register or Criterion 1 of the California Register. Poly HS was constructed during a period of accelerated growth in Los Angeles. During the Postwar period, Los Angeles quickly grew outward and expanded into the San Fernando Valley where farmland was redeveloped into housing subdivisions. Because of the rapid increase in population in the San Fernando Valley, there was an increased demand for schools and as a result Poly HS was one of many new schools constructed in the San Fernando Valley during this period of accelerated growth. While Poly HS reflects a pattern of increased Postwar development resulting from the suburbanization of the San Fernando Valley, Poly HS does not appear to have made a significant contribution to the broad patterns of our history. The construction of Poly HS was part of the larger development of the San Fernando Valley and its completion was not an important event, milestone or factor driving the Valley's popularity and exponential growth. Furthermore, it appears the design finger-plan and cluster-plan hybrid design of Poly HS did not influence the designs of other District schools, as these plan types were already established in the District by the time the construction of Poly HS in its entirety was completed in 1958.

Poly HS does not appear to satisfy National Register Criterion B or California Register Criterion 2 for eligibility related to a historic personage. Research within the *Los Angeles Times* and other databases has not identified Poly HS with the productive life of any significant individual District teachers, principals, administrators, students, or any other persons important in our past.

With regard to architecture, design or construction, Poly HS retains integrity and embodies the character-defining features of a Postwar Modern functionalist campus, such as the unified campus design, combination cluster-and finger plan, low massing, flat roofs, integration of outdoor rooms, corridors connecting buildings, central quad, and modern use of brick. While Poly HS represents the Postwar design trends for high schools, Poly HS does not appear to be a distinctive or innovative example of a Mid-Century Modern style campus. There are other more notable examples of Postwar Modern junior and high schools in the LAUSD constructed during the same period, such as Chatsworth Senior High School, Palisades Senior High School, Grover Cleveland High School, and Marina del Rey Junior High School. Furthermore, it appears there are better examples of the finger-and-cluster plan hybrid within the District, such as Sumner Spaulding and John Rex's Orville's design for Wright Middle School (originally Westchester High School) constructed between 1948 and 1952 and Roland H. Crawford's design for George K. Porter Middle High constructed in 1959. Both of these schools were designed by master architects who established architectural trends for school design and could be referred to as master architects. It appears the Austin, Field, and Fry, the architecture firm responsible for the design of Poly HS, was influenced by the Postwar designs established by other architects within the District, in addition to trends popularized in architectural journals.

While Poly HS was designed by Austin, Field and Fry, a prominent Southern California architectural firm, they were responsible for the design, planning, and engineering of over 75 educational projects throughout the firm's accomplished career. Within their overall body of work, Poly HS appears to be a representative example of their educational architecture and master planning of the mid to late 1950s, but does not appear to rise to the threshold of one of their better works. Their more notable educational projects include Compton College (1953, and subsequent additions); Otis Art Institute (1957); Mt. San Antonio College (1963); and Alhambra High School (1964); and four buildings for UCLA, Dodd Hall, Campbell Hall, Humanities Building and the Faculty Center, designed between 1948 and 1959. For the design of the Humanities building UCLA, Austin, Field, and Fry won accolades from *Progressive Architecture*. Within the larger context of Austin, Field, and Fry's educational and institutional architecture, Poly HS does not appear to be a distinctive or notable project. Therefore, it appears Poly HS is not a notable work of the architecture firm of Austin, Field and Fry, and is not a distinctive example of a Postwar Modern functional campus. Thus, Poly HS is ineligible for listing under National Register Criterion C and California Criterion 3 for its architecture.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Poly HS is sited on a 37.20-acres irregular-shaped lot, almost a polygon, improved with Mid-Century Modern style one-story campus type classroom buildings, an auditorium, cafeteria, library, and a boys and girls gymnasium. The rear of the property is improved with athletic fields, asphalt playgrounds, and tennis courts. The site plan turns inward on itself with permanent school buildings arranged in a combination cluster- and finger-plan within the southern portion of the lot. The buildings are grouped by function and are connected by canopies to form a unified plan. Designed in the Postwar Modern style, Poly HS expresses the character-defining features of the style through its unified campus design, combination cluster-and finger-plan, low massing, flat roofs, outdoor corridors, courtyards, covered walkways, central quad, and modern materials.

Overall the permanent buildings are designed in the Postwar Modern style and are one-story (except for the Boy's Gymnasium (Building 46), Girl's Gymnasium (Building 45), Cafeteria (Building 23), Auditorium (Building 1), Building 4, Building 5, and Building 59). The buildings are characterized by concrete foundations, wood-frame construction, rectangular massing and plans, veneered brick and stucco wall finishes, metal sun louvres, and simplified volumes. Design emphasis is placed on maximizing the relationship of the building interiors to the outdoors, thus the buildings have multiple windows for natural light and open out onto outdoor courtyards. The fenestration includes fixed, awning, and double-hung wood-frame windows (alteration, windows are covered with metal security screens and some windows have been removed to accommodate AC units). The majority of doors are flat-panel doors with rectangular viewing windows (alteration, windows covered by metal security screens) with wood-frame transom windows (alteration, some of the windows are covered).

Area: Los Angeles County
Period of Significance: 1955-1957 **Property Type:** High School **Applicable Criteria:** None
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Poly HS is representative of a Postwar Modern style school designed by the prominent Los Angeles architecture firm Austin, Field, and Fry. The period of significance is between 1956 and 1958, the span of time in which Poly HS was constructed. The school was evaluated against the theme of Educating the Baby Boom-The Postwar Modern, Functionalist School Plant (1945-1969) developed in the LAUSD Historic Context Statement. The subject school was evaluated within the context of this theme against the applicable national and state criteria. As a result of PCR's investigations, Poly HS appears ineligible under National Register and California Register criteria due insufficient historical significance and architectural merit. Therefore, PCR reaffirms the previous NRHP Status Code of 6Z assigned to the subject school during the 2013/2014 LAUSD Historic Resources Survey. Greater detail is provided on the continuation sheets.

B6. Construction History

Historic Overview

At the close of World War II, the United States entered a period of unprecedented growth, with booms to both the economy and the population. This sudden shift from the austerity of the Great Depression and the war years into a period of great prosperity meant that demand far outstripped supply for most commodities and services, including that of public schools. This was especially true in California, which experienced not only the baby boom but an influx of new residents coming in from other states for jobs in California's various industries.[i]

In the 1950s, the population of the West San Fernando Valley was growing with extreme rapidity. The communities of Sun Valley, Northridge, Reseda, and Tarzana proved especially problematic in terms of providing adequate public school facilities for the ever-increasing number of families moving into the area. The population of these three communities exploded in a very short period, from about 32,000 in 1950 to over 80,000 by 1954. This massive increase in population resulted in numerous building projects carried out in the area by LAUSD, including the construction of a new campus for Poly HS (Figure 1) in the San Fernando Valley between 1955 and 1957, with its official opening in February 1957. Poly HS was established in 1905, with its original campus located at the corner of Washington Boulevard and Flower Street in downtown Los Angeles.[ii] Poly HS moved from its former site in 1935, and the school was renamed from Polytechnic High School to John H. Francis Polytechnic High School in honor of the school's founder and first principle.[iii]

Modern architecture came to dominate public school buildings constructed during this period, both in California and across the United States. The primary consideration in school design became function rather than style, with architects largely rejecting the historicist, hierarchical design elements that had traditionally held sway. Emphasis shifted to the experience of the pupil, and architects attempted to provide environments appropriate to the age of the student. Therefore, decentralization, informality, easy outdoor access and smaller scale prevailed. Indoor-outdoor integration of space, once considered experimental, became a staple of school design, especially in California where the climate was suited to year-round indoor-outdoor living. Modular, prefabricated design made schools more affordable and supported the design sensibilities of the period.[iv]

Two new school site plan typologies emerged in the 1940s and 1950s, the finger-plan and the cluster-plan. The finger-plan actually originated in the late 1930s, but was not fully embraced until after the end of World War II. The basic concept of this type of site plan was a layout that resembled a tree trunk with branches extending out on either side. This type of plan relied upon standardized classrooms, all with the same (preferably north) orientation, and was popular for both its flexibility and expandability. However, the design could also be difficult to adapt to different topographies, required large amounts of land, and tended to increase time spent traveling from one part of the school to another. Therefore, in the 1950s, the cluster-plan school emerged as a more universally usable and cost-effective option. Cluster-plan schools were oriented around a central courtyard, rather than along an axis. The experience of the school was therefore more communal and could also be built on smaller and more topographically varied lots. Furthermore, the plan allowed for more shared spaces and easier supervision of students. Many schools were also designed as hybrids of these two popular plans.[v]

Poly High Construction History

The initial plans for Poly HS were drawn between 1955 and 1957 by the architecture firm of Austin, Field and Fry and landscape architect Clifford G. Schoen.[vi] There are five sets of drawings archived in the LAUSD drawing archive covering the intial design of the campus spanning the period of May 1955 to December 1957. On January 2, 1955 the *Los Angeles Times* announced the first phase of the project was under construction and included an architectural rendering (Figure 1) of the proposed school.[vii] The article stated the first phase of the project would house 1,000 students, with the ultimate school capacity being 2,500 students, and cost approximately $2,500,000. Two years later, the school construction was published again in the *Los Angeles Times* on May 12, 1957 claiming all of the "administrative and classroom buildings in the $5,000,000 project have been completed and the only structure yet to be finished is the auditorium….funds for the new school were obtained from $233,000,000 Los Angeles city school bond issues approved in two elections over the past five years."[viii]

B6. Construction History (continued)

As discussed in the previous paragraph, there appears to be phases of design work covered in five sets of architectural plans. The first design phase covered in the architectural set dated May 13, 1955 included the overall layout of the campus and the plans, elevations, and sections for the Administration, Music, Homemaking, Art, Industrial Arts, Science, Agriculture, Cafeteria, Bookstore and two Classroom Buildings.[ix] The spatial layouts for the site plans for the future were indicated on the plot plans. The layout of the school was known as "campus type," where all buildings are one-story and open to outdoor hallways, and the plan was a combination of both the cluster plan and finger plan types.

The second set of plans dated January 16, 1956 provides drawings for the Boys Gymnasium and Girl's Gymnasium located in the north and northwest portions of the campus.[x] In September of 1956 two sets of drawings were produced. A set of drawings dated September 1, 1956 included the specifications for the rows of classroom buildings and Library located to the east and west of the Administration Building.[xi] This set of plans also included landscape designs by Clifford F. Schoen. Also, in 1956 a plan set was produced for the temporary buildings constructed to the west of the agricultural area. These buildings would later be replaced by a two-story classroom building built in 2005.[xii] Finally, in 1957 a set of drawings provide the specification for the Auditorium buildings added at the southern portion of the campus.[xiii] Upon completion of Poly HS, it was featured in an architectural exhibit of Austin, Field, and Fry's "buildings of special historical and architectural interest" hosted at the Building Center at 7933 W 3rd Street, Los Angeles in April of 1958.[xiv]

It appears that the school campus has undergone very few major alterations since its initial construction. In 1968, Classroom Building 39/N was added in 1968. A number of repairs were made to the Administration Building (Building 9) following a fire as specified in a November 1982 plan set.[xv] After the Northridge earthquake of 1994, repair of earthquake damage to various buildings, arcade, playground and parking was conducted.[xvi] The windows were replaced in the Cafeteria building to include new serving windows and coiling counter doors in 1996.[xvii] To the north of Building 5 and north of Building 46 (Boy's Gymnasium) portable units were added in 1962, 1972, 1997 and 2000.

Architecture Firm of Austin, Field and Fry

The architectural and engineering firm of Austin, Field, and Fry were the architects of the Poly HS. The firm was comprised of John Corneby Wilson Austin (1870-1963), Robert Alexander Field, Jr. (1902-1984), and Charles Eugene Fry (1906 - 1998) was established in Los Angeles in 1946.[xviii]

The firm's founding principal, John Corneby Wilson Austin (1870-1963), was born in Oxfordshire, England, educated at English schools, and apprenticed under the architect William Sampson Barwick. He immigrated to the United States from England in 1888. For three years, he lived in San Francisco, until 1895 when he moved to Los Angeles where he became a renowned architect and community leader. He is known to have worked briefly for the firm of Morgan and Walls before opening his own office. He worked alone and in partnership with Chauncey F. Skilling, W.C. Pennell, Frederick M. Ashley, and after the Second World War with Robert Field and Charles Fry. He was president of the first State Planning Board, member of the State Board of Architectural Examiners, president and on the board of directors of the Chamber of Commerce, member of the Royal Society of Arts in Great Britain, and fellow of the American Institute of Architects. John C. Austin died in Los Angeles on September 3, 1963.

John C. Austin, a master architect of his period, specialized in the design of large-scale civic, educational, and ecclesiastical architecture that followed the trends in architecture. He is known as one of the most important architects practicing in the Los Angeles and Southern California region during the first quarter of the 20th century. A consummate professional and interpreter of several architectural styles, Austin pledged no allegiance to any particular style. As his architectural career spanned approximately 68 years, he adapted his designs to the changing styles and attitudes in architecture. His extant ecclesiastical projects include the Gothic Revival Holliston Avenue United Methodist Church (ca. 1899), located at the northwest corner of Holliston Avenue and Colorado Boulevard, Pasadena; the shingled Gothic Grace Methodist Episcopal Church (ca. 1906) at 200 N. Saint Louis Avenue, Boyle Heights; and he collaborated with A. M. Edelman, and G. Albert Lansburgh in the design of the Moorish Revival style Shrine Auditorium, also known as the Al Malaikah Temple at 665 W Jefferson Boulevard, Los Angeles (ca. 1920-26).[xix]

Architecture Firm of Austin, Field and Fry (continued)

John C. Austin's civic projects include the Griffith Park Observatory and Planetarium (ca. 1935), and Pico Gardens Public Housing (ca. 1941-42). His educational projects include the Frank Wiggins Trade School, Los Angeles High School, Monrovia High School (ca. 1928), the Administration Building at Hamilton High School (ca. 1931), the Administration Building at John Muir Middle School (ca. 1922), Venice High School (ca. 1913-1914), Walter Reed Middle School (1939), San Fernando Middle School (ca. 1916), and the Florence Nightingale Junior High School (ca. 1937-1939). Austin was associated with Frederic Morse Ashley (1870-1960), his partner in the firm Austin and Ashley, Architects, between 1929 and 1935.[xx]

Following World War II, John C. Austin formed Austin, Field & Fry, an architecture and engineering firm, with Robert Field and Charles Fry in 1946.[xxi] Robert Field (1902-1984) was born in Chicago, Illinois in 1902, later attended Manual Art High School, Los Angeles, and graduated from University of Southern California in 1940. Charles Eugene Fry (1906-1996) was born in Los Angeles in 1906 and later attended Manual Art High School and received his B.S. in architecture at University of Southern California. In 1930, he began an apprenticeship with John C. Austin and F.M. Ashley, Architects as an Architectural Draftsman until World War II. During World War II he was in charge of airport design, construction, repairs and utilities for the United States Army Air Corps and obtained the rank of Colonel.

With their office headquartered at 2311 West 3rd Street, Austin, Field, and Fry planned and designed large-scale institutional and commercial projects including hospitals, industrial and business centers, and schools throughout Southern California. Notable projects include St. Vincent's Hospital (original 1927, additions in 1952, 1956); North American Aviation, Inc. (1957); Superior Court of California, County of Los Angeles, Courthouse #4 (1958); California Electric Power Company (1958); First Federal Savings and Loan Association of Hollywood (1959); Western and Southern Life Insurance Company (1960); Thiokol Chemical Corporation (1960); Shell Development Company (initial 1957, second unit 1962); and Josten Manufacturing Plant (1957).[xxii]

The firm specialized in the design and master planning of school campuses, elementary schools to colleges. A *Los Angeles Times* article reporting on the design of Torrance High School on July 23, 1961, noted the firm "has planned, design and engineered more than 75 major facilities at high schools and grammar schools throughout Southern California."[xxiii] Notably they designed four buildings at the University of California, Los Angeles between 1948 and 1959, including Dodd Hall (1948), Campbell Hall (1954), Humanities Building (Rolfe Hall)(1956), and Faculty Center (1959). The design of the Humanities Building won an award citation award in the education category of an architectural design competition sponsored by *Progressive Architecture*, a national architectural magazine.[xxiv] Other educational project include Highland Oaks School, Arcadia (1949);[xxv] Compton College (1953, and subsequent additions); Hugo Reid Elementary School, Arcadia (1956)[xxvi]; Otis Art Institute (1957); Newhall Elementary School, Newhall (ca. 1959)[xxvii]; Arcadia Unified School District's administration building (ca. 1961)[xxviii]; Torrance High School (ca. 191)[xxix]; redevelopment of Mt. San Antonio College (1963)[xxx]; and Alhambra High School (1964) ; Suva and La Merced for the Montebello Unified School District (ca. 1973)[xxxi] Within LAUSD, it appears Austin, Field and Fry designed a classroom building at Hamilton High School (ca. 1957) and Carson Senior High School (1969).

*Recorded by: PCR Services *Date: 6/28/2016 ☒ Continuation ☐ Update

P3a. Description (continued)

There are two school entrances (Figures 4 and 5) located near the southwest and southeast corners of the property at opposite ends. The entrances are connected by an access road that creates a division between the bottom southern end of the property, the more public sphere where the parking lots, auditorium and administration building are located, from the northern portion, the more private sphere, where the classroom buildings, gymnasiums and playing fields are located. Located in this southern portion are the Auditorium and building 2 flanked by two asphalt parking lots.

The Auditorium (Figures 6 and 7) is two-stories with an irregular T-shaped plan consisting of a rectangular portion for the back of the house functions connected to the main auditorium and stage. The Auditorium appears to be reinforced concrete construction with a smooth painted stucco finish. The primary (north) elevation is curved. The entrance story is veneered in brick while the heavy top story has regularly spaced vertical grooved recessed into the smooth concrete. Four pairs of flat-panel doors are recessed into the brick veneer interrupted by a central ticket window. To the west of the Auditorium is Building 2 (Figure 7) a simple building with a rectangular plan, covered by a shed roof, sheathed in stucco and brick veneer, and punctuated by awning windows, double hung windows, and flat panel doors.

Located across from the auditorium building, on the north side of the access road, are the Administration and Library buildings connected by an east-west canopy supported by rectangular brick veneered piers. Situated centrally between the administration and library buildings is a north-south canopy aligned extending to the main canopy that connects all the classroom buildings. This north-south canopy along with the Auditorium, Library, Administration Building, Quad, Cafeteria, and Girl's Gymnasium are arranged along a north-south access centered in the middle of the lot.

The Administration Building (Figure 8 and 9) has a rectangular plan with a central corridor and is covered by a low-pitch front gable roof. The Administration Building is veneered in brick and has window openings on the east and west elevations covered by a deep roof overhang. Located on the north and south elevation are the entrances accessed through a pair of flat panel doors with side lights and transom windows. Located to the direct east of the administration building is the library.

The Library (Figures 10 and 11) has a T-shaped plan and is veneered in brick with entrances into the Library are located on the east elevation. The other elevations have double hung windows shielded by sun louvres and brick wing walls.

The campus plan is anchored by a polygon shaped Central Quad (Figures 12 and 13). The quad is framed by covered walkways supported by slender metal posts, with the exception of the covered walkway at the north end attached to the cafeteria (Building 23), which is supported by rectangular brick veneered piers. The covered walkway is an important architectural feature that unifies the campus, provides access between buildings, defines the relationship of buildings and spaces, and provides a transition between indoor and outdoor space. At the south end of the quad is a concrete platform stage framed by an ornamental brick wall and at the north end is the Cafeteria Building 23. The Central Quad has concrete walkways stretching across the polygon at all five points and the spaces created between the walkways are planted with grass.

Along the southeast and southwest sides of the quad are classroom buildings radiating out from the covered walkways at a forty-five degree angle arranged in a finger plan. The southwest side has four classroom buildings (Buildings 6, 7, and 8), while the southeast side has six classroom buildings (Buildings 25, 26, 27, 28, 29, 30) arranged in three rows of two and one classroom building (Building 31) much wider with an interior hallway. Each row of classroom buildings has a sanitary building attached to the north end via a covered walkway that unites the classroom buildings and overall campus together. The classroom buildings have single-door openings, lockers, and clerestory windows shielded by sun louvres and a deep roof overhang supported by rectangular piers on the south elevations, while the opposite side is punctuated with double-hung wood-frame windows. The classrooms are sheathed with stucco and brick veneer and covered by flat roofs, except for Building 31 that has a front-gable roof and is completely veneered in brick. Representative photographs of the classroom buildings are provided in Figures 14 to 17 below. Classroom Buildings 6, 7 and 8 are protected from the street by two-story Buildings 4 and 5 (Figures 18 and 19) and are articulated with the same architectural details as the classroom buildings described above. Connected to the east elevation of Building 5 are Buildings 12 and 13.

*Recorded by: PCR Services *Date: 6/28/2016 ☒ Continuation ☐ Update

P3a. Description (continued)

Anchoring the north side of the quad is the Cafeteria. The two-story Cafeteria (Figures 20 to 23) has a rectangular plan, veneered with brick and is devoid of excess ornamentation. Attached to the south elevation is a canopy supported by large rectangular piers. The lunch shelter supported by square metal columns is attached to the west and rear (north) elevations under which there are pairs of double doors and lunch counter windows (alteration, replaced). In front of the lunch shelter is a row of three square planter boxes with trees and Building 22, the Student Store building.

Located directly behind the Cafeteria is the Girl's Gymnasium. The Girl's Gymnasium (Figures 24 to 25) has a rectangular plan and massing and is composed of at least three rectangular volumes. Veneered in brick, the primary two-story volume housing the gymnasium are onmented with concrete piers spaced at regular intervals. The rear and side elevations have awning and double-hung windows, as well as single and double flat panel doors some with transom windows.

To the northeast of the quad is the one-and-two story utility building, Building 24. Veneered in brick and sheathed in stucco, Building 24 (Figure 26) has an irregular plan with a curved wall wrapping from the east to north elevations. Building 24 has louvre windows, flat panel doors, and awning and double-hung windows.

The Boy's Gymnasium is located to the west of the Cafeteria and Girl's Gymnasium, has a rectangular plan, and is veneered in brick (alteration, some of the brick has been poorly patched). The Boy's gymnasium (Figures 27 and 28) is composed of four square volumes with varying heights, the tallest and largest volume containing the main gymnasium space. The gymnasium volume has concrete piers spaced at regular intervals embellishing the second floor of all four elevations. A canopy is attached to the primary elevation under which there are a number of opening, single and double panel doors, into the various spaces. The side and rear elevations have awning and double-hung windows (alteration, covered by metal security screens).

The Agricultural Area (Figures 29 to 30) is located at the southeast corner of the school site and is a rectangular parcel of land. Within the agricultural area are four simple buildings (Buildings 40, 41, 42, 43) constructed between 1956 and 1957. This area is improved with many mature palm trees and planting beds.

Integrity Analysis

Poly HS retains all seven aspects of integrity from its period of significance (1956-1958): location, materials, workmanship, design, setting, feeling, and association. The school occupies its original location. Regarding setting, the school retains its original setting including the landscape, canopies, relationship between the buildings and open space, and surrounding neighborhood context. The subject school expresses the Postwar Modern architectural aesthetic of simplicity of design, emphasis on the relationship of the buildings to the outdoors, geometric forms, and a unified site plan. Regarding materials, design and workmanship, Poly HS retains the majority of its character-defining buildings, features, spaces, materials, and overall plan. Alterations include the installation of metal security screens, infill of window openings with AC equipment, painting over of windows, handicap upgrades, painting over and patching of brick veneer, and replacement of the cafeteria serving windows. The overall plan of the school remains intact despite some open spaces being filled in with relocatable buildings. Despite these alterations, Poly HS retains integrity of materials, design and workmanship. Because the school has changed minimally since it was constructed between 1956 and 1958, it continues to express the aesthetic and historic feeling of a Postwar era school designed by Austin, Field and Fry and retains integrity of feeling. As a result, Poly HS conveys historical associations under the theme of Educating the Baby Boom-The Postwar Modern, Functionalist School Plant (1945-1969) developed within the LAUSD Historic Context Statement.

*Recorded by: PCR Services *Date: 6/28/2016 ☒ Continuation ☐ Update

B10. Significance (continued)

In regards to the broad patterns of history, Poly HS does not reach the threshold for significance under Criterion A of the National Register or Criterion 1 of the California Register. Poly HS was constructed during a period of accelerated growth in Los Angeles. During the Postwar period, Los Angeles quickly grew outward and expanded into the San Fernando Valley where farmland was redeveloped into housing subdivisions. Because of the rapid increase in population in the San Fernando Valley, there was an increased demand for schools and as a result Poly HS was one of many new schools constructed in the San Fernando Valley during this period of accelerated growth. While Poly HS reflects a pattern of increased Postwar development resulting from the suburbanization of the San Fernando Valley, Poly HS does not appear to have made a significant contribution to the broad patterns of our history. The construction of Poly HS was part of the larger development of the San Fernando Valley and its completion was not an important event, milestone or factor driving the Valley's popularity and exponential growth. Furthermore, it appears the design finger-plan and cluster-plan hybrid design of Poly HS did not influence the designs of other District schools, as these plan types were already established in the District by the time the construction of Poly HS in its entirety was completed in 1958.

Poly HS does not appear to satisfy National Register Criterion B or California Register Criterion 2 for eligibility related to a historic personage. Research within the *Los Angeles Times* and other databases has not identified Poly HS with the productive life of any significant individual District teachers, principals, administrators, students, or any other persons important in our past.

With regard to architecture, design or construction, Poly HS retains integrity and embodies the character-defining features of a Postwar Modern functionalist campus, such as the unified campus design, combination cluster-and finger plan, low massing, flat roofs, integration of outdoor rooms, corridors connecting buildings, central quad, and modern use of brick. While Poly HS represents the Postwar design trends for high schools, Poly HS does not appear to be a distinctive or innovative example of a Mid-Century Modern style campus. There are other more notable examples of Postwar Modern junior and high schools in the LAUSD constructed during the same period, such as Chatsworth Senior High School, Palisades Senior High School, Grover Cleveland High School, and Marina del Rey Junior High School. Furthermore, it appears there are better examples of the finger-and-cluster plan hybrid within the District, such as Sumner Spaulding and John Rex's Orville's design for Wright Middle School (originally Westchester High School) constructed between 1948 and 1952 and Roland H. Crawford's design for George K. Porter Middle High constructed in 1959. Both of these schools were designed by master architects who established architectural trends for school design and could be referred to as master architects. It appears the Austin, Field, and Fry, the architecture firm responsible for the design of Poly HS, was influenced by the Postwar designs established by other architects within the District, in addition to trends popularized in architectural journals.

While Poly HS was designed by Austin, Field and Fry, a prominent Southern California architectural firm, they were responsible for the design, planning, and engineering of over 75 educational projects throughout the firm's accomplished career. Within their overall body of work, Poly HS appears to be a representative example of their educational architecture and master planning of the mid to late 1950s, but does not appear to rise to the threshold of one of their better works. Their more notable educational projects include Compton College (1953, and subsequent additions); Otis Art Institute (1957); Mt. San Antonio College (1963); and Alhambra High School (1964); and four buildings for UCLA, Dodd Hall, Campbell Hall, Humanities Building and the Faculty Center, designed between 1948 and 1959. For the design of the Humanities building UCLA, Austin, Field, and Fry won accolades from *Progressive Architecture*. Within the larger context of Austin, Field, and Fry's educational and institutional architecture, Poly HS does not appear to be a distinctive or notable project. Therefore, it appears Poly HS is not a notable work of the architecture firm of Austin, Field and Fry, and is not a distinctive example of a Postwar Modern functional campus. Thus, Poly HS is ineligible for listing under National Register Criterion C and California Criterion 3 for its architecture.

ATTACHMENT B – PROFESSIONAL QUALIFICATIONS

Margarita Jerabek, Ph.D.

ASSOCIATE PRINCIPAL, DIRECTOR OF HISTORIC RESOURCES

SUMMARY

Margarita Jerabek has 25 years of professional practice in the United States with an extensive background in historic preservation, architectural history, art history and decorative arts, and historical archaeology. She specializes in Visual Art and Culture, 19th-20th Century American Architecture, Modern and Contemporary Architecture, Architectural Theory and Criticism, Urbanism, and Cultural Landscape, and is a regional expert on Southern California architecture. Her qualifications and experience meet and exceed the Secretary of the Interior's Professional Qualification Standards in History, Archaeology, and Architectural History. She has managed and conducted a wide range of technical studies in support of environmental compliance projects, developed preservation and conservation plans, and implemented preservation treatment projects for public and private clients in California and throughout the United States.

EXPERIENCE

Dr. Jerabek has prepared a broad range of environmental documentation and conducted preservation projects throughout the Los Angeles metropolitan area and Southern California counties. She provides expert assistance to public agencies and private clients in environmental review, from due diligence through planning/design review and permitting and when necessary, implements mitigation and preservation treatment measures on behalf of her clients. As primary investigator and author of hundreds of technical reports, plan review documents, preservation and conservation plans, HABS/HAER/HALS reports, construction monitoring reports, salvage reports and relocation plans, she is a highly experienced practitioner and expert in addressing historical resources issues while supporting and balancing project goals.

She is an expert in the evaluation, management and treatment of historic properties for compliance with Sections 106 and 110 of the NHPA, NEPA, Section 4(f) of the Department of Transportation Act, CEQA, and local ordinances and planning requirements. Dr. Jerabek regularly performs assessments to ensure conformance with the Secretary of the Interior's Standards for the Treatment of Historic Properties, and assists clients with adaptive reuse/rehabilitation projects by providing preservation design and treatment consultation, agency coordination, legally defensible documentation, construction monitoring and conservation treatment.

She is a regional expert on Southern California architecture. She has prepared a broad range of environmental documentation and conducted preservation projects throughout the Los Angeles metropolitan area as well as in Ventura, Orange, Riverside, San Bernardino and San Diego counties. Beyond her technical skill, Dr. Jerabek is a highly experienced project manager with broad national experience throughout the United States. She currently manages PCR's on-call preservation services with the City of Santa Monica, County of San Bernardino Department of Public Works, City of Hermosa Beach, Los Angeles Unified School District, and Long Beach Unified School District.

Education

Amanda Kainer, M.S.

SENIOR ARCHITECTURAL HISTORIAN

SUMMARY

Amanda Kainer has more than eight years of professional and academic experience in the practice of historic preservation and architectural history. Ms. Kainer has conducted extensive archival research, field observation, recordation, and prepared survey documentation and assisted in database management for numerous PCR historic resources projects. She has training and substantial experience in the evaluation and conservation of art and architecture and passion for interior design.

EXPERIENCE

Ms. Kainer has completed and co-authored a wide range of architectural investigations including historic resources assessment and impacts analysis reports for compliance with CEQA, character-defining features reports, plan reviews, investment tax credit applications, Section 106 significance evaluations, and HABS documentations. She has also performed extensive research, survey work, and prepared numerous landmark and preliminary assessment reports as a part of PCR's On-Call Historic Preservation Contract with the City of Santa Monica.

She is involved a diverse set of projects and analyses. These include anything from a California Register nomination for the UCLA Faculty Center to a paint analysis for a Churrigueresque style 1920s commercial building in Santa Monica. She has co-authored Section 106 reports for the residential development in Thousand Oaks, Santa Monica Pier, Avalon Fuel Dock on Catalina Island, and a Mid-Century roadside motel in Bakersfield. For LAUSD, Ms. Kainer authored a character-defining features analysis for seven historic schools, provided historic analysis for an MND, and preliminary resource evaluations and plan reviews for various historic schools.

Historic Resources Assessments: Ms. Kainer has contributed to the research, site inspections, and report preparation of a number of historic resources assessments in the Los Angeles metropolitan area for compliance with CEQA. Ms. Kainer has evaluated a number of different types of potential historical resources, including single-family and multi-family residences, banks, commercial buildings, schools, hotels, and cultural landscapes in Beverly Hills, Venice, Los Angeles, and Santa Monica.

Large Scale Survey Experience: She was a contributing author for three major Community Redevelopment Agency of the City of Los Angeles–Adelante Eastside, Wilshire Center/Koreatown, and Normandie 5 Redevelopment Areas. Ms. Kainer also served as PCR Survey Team Leader and co-author for the comprehensive survey of over 4,000 objects of fine and decorative arts aboard the RMS Queen Mary in Long Beach. Additionally, Ms. Kainer helped complete the district-wide survey and evaluation of the Long Beach Unified School District and a windshield survey of Hermosa Beach for the Historic Resources Chapter of the Hermosa Beach General Plan Update.

Dear Mr. Maghadam:

We are pleased to submit the results of our geotechnical investigation in support of the proposed modernization of Francis Polytechnic Senior High School in Sun Valley, California. This investigation was conducted in general accordance with our proposal dated April 10, 2015 and Task Order No. 003.01, dated August 4, 2016, under the Professional Services Agreement for Geotechnical Engineering Support Services (Contract No. 1590051/4400003490) between the Los Angeles Unified School District and our firm, dated April 1, 2015.

The scope of our services was planned with Ms. Cristina Cho of your office. Ms. Cho has furnished us with a general site plan for the planned modernization. Detailed information regarding the proposed structures, including size, location, and structural loading information, is not available at this time and will ultimately be determined by the selected design build team(s).

The results of our investigation and design recommendations are presented in this report. Please note that you or your representative should submit copies of this report to the appropriate governmental agencies for their review and approval prior to obtaining a building permit.

EXECUTIVE SUMMARY

We have completed our geotechnical investigation for the proposed school modernization project on the campus of Francis Polytechnic Senior High School in Sun Valley, California. Our subsurface explorations, engineering analyses, and foundation design recommendations are summarized below.

The proposed modernization is planned to consist of the construction of several buildings at the site. Several existing structures will be demolished in order to accommodate the new construction. The remaining existing classroom buildings are planned to evaluated and modernized. The new buildings include an Administration Building, Library & Classroom Building, a Science & General Classroom Building, a lunch shelter, two Toilet Buildings, a Gymnasium Building, and an Auditorium & Performing Arts Building. The exact configuration of the new construction is still under development and will ultimately be determined by the selected design-build team(s). No subterranean construction is anticipated, the lowest finished floor elevations of new structures are anticipated to be at about the existing grade, and the proposed structures are anticipated to be one- to two-stories in height.

We explored the soil conditions by drilling a total of 18 borings at the site. Fill soils, up to 5½ feet thick, were encountered in our borings. The natural soils underlying the fill consist of silty sand at some locations within approximately the upper 5 feet. The fill and natural silty sand is underlain by predominantly medium dense to very dense well-graded sand with gravel and cobbles and poorly graded sand. The upper silty sand soils may be somewhat susceptible to hydroconsolidation and may become somewhat weaker and more compressible when wet. Groundwater was not encountered within the maximum 50-foot depth explored by our borings; the historic-high groundwater level is mapped at a depth of approximately 140 feet beneath the existing ground surface at the site. The corrosion tests indicate that the on-site soils are moderately corrosive to ferrous metals, aggressive to copper, and that the potential for sulfate attack on portland cement concrete is considered negligible.

Based on the available geologic data, active or potentially active faults with the potential for surface fault rupture are not known to be located directly beneath or projecting toward the site. Therefore, the potential for surface rupture due to fault plane displacement propagating to the surface at the site during the design life of the proposed project is considered low. The site could be subjected to strong ground shaking in the event of an earthquake, this hazard is common in Southern California and the effects of ground shaking can be mitigated by proper engineering design and construction in conformance with current building codes and engineering practices.

The relatively flat-lying topography at the site precludes both stability problems and the potential for lurching (earth movement at right angles to a cliff or steep slope during ground shaking). The school property is within a Methane Zone according to the City of Los Angeles. For new structures, a subsurface methane investigation would be required and if testing indicates that methane is present at the site, then a permanent methane gas control system may be necessary beneath proposed buildings at the site. According to the City and County of Los Angeles, the site is within potential dam inundation area. Dams are routinely inspected by state and federal agencies, therefore, the potential for inundation is low. The potential for other geologic-seismic hazards such as liquefaction,

tsunamis, seiches, flooding, asbestos, radon gas, and subsidence affecting the site is considered low. We estimate that the seismically-induced settlement could be on the order of ½ inch or less beneath the site in the event of maximum considered earthquake ground motions.

Records documenting the placement and compaction of the existing fill soils encountered within the project area are not available; therefore, the existing fill soils are not considered suitable for support of new structures on conventional spread/continuous footings. If the existing fill soils are excavated and replaced as properly compacted fill soils, the planned structures may be supported on conventional spread/continuous footings established on properly compacted fill soils and/or undisturbed natural soils and the floor slabs may be supported on grade. If the footings are established in the undisturbed natural well-graded or poorly graded sand materials, which may require deepening in some locations, a higher bearing value may be used in the design. The deepening of the footings could be accomplished by excavating the footing excavations to a greater depth than designed and backfilling the lower portion of the excavation with structural concrete (or sand-cement slurry containing at least 3 sacks of cement per cubic yard) up to the design bottom of footing elevation.

Ideally, to provide support for new paving and other exterior concrete walks and slabs on grade, all existing uncertified fill soils should be removed and replaced as properly compacted fill. However, if the risk of some settlement and greater than normal future maintenance is acceptable to LAUSD, then the removal of existing uncertified fill soils may be limited to the upper 2 feet beneath the pavement/slab section. However, after the 2-foot removal is completed, the exposed subgrade should be carefully observed by a representative of our firm to identify any soft areas that may require additional excavation and compaction.

We recommend that provisions for positive surface drainage away from foundations be incorporated into the site grading plans. Impoundment of stormwater run-off within the construction area should not be permitted within the immediate vicinity of the foundation construction area. We also recommend avoiding the placement of planters, underground water pipes, or any other source of additional water to the subsurface soils in the immediate vicinity of the foundations. If planter or landscaped areas are desired within 20 feet of the foundations, these areas should have impermeable bottoms. In addition, we recommend pressure testing of utility lines prior to backfilling to detect and eliminate leaks due to poor workmanship or material defects.

1.0 SCOPE

This report provided geotechnical recommendations in support of the proposed modernization of the Francis Polytechnic Senior High School campus in Sun Valley, California. The location of the site is illustrated on Figure 1, Vicinity Map. The locations of the existing buildings, our exploration borings, and the general locations of potential project elements are shown on Figure 2, Plot Plan.

We submitted the results of our preliminary geotechnical investigation for the proposed modernization in a report dated July 13, 2015 (our Job No. 4953-15-0432). The locations of our prior explorations borings are shown on Figure 2. The recommendations in the current report were developed in part using geotechnical information from our preliminary investigation.

This investigation was authorized to determine the static physical characteristics of the soils at the site, and to provide recommendations for design of foundations and minor retaining walls, for floor slab and paving support, and for grading. More specifically, the scope of our services included the following:

- Evaluate the current and previous subsurface explorations to determine the nature and stratigraphy of the subsurface soils within the subject site.
- Perform a geologic-seismic hazards evaluation in general conformance with Title 24 of the California Code of Regulations and with the California Geological Survey Checklist for Review of Geologic-Seismic Reports for California Public Schools, Hospitals, and Essential Services Buildings (CGS Note 48) to address geologic and seismic hazard considerations.
- Recommend an appropriate foundation system together with the necessary design parameters, including frictional resistance, passive resistance, and anticipated total and differential settlements.
- Determine the applicable seismic design parameters based on the current California Building Code (CBC), including a site-specific ground motion hazard analysis.
- Provide recommendations for subgrade preparation and floor slab support.
- Provide recommendations for design of minor retaining walls.

- Provide recommendations for design of asphalt and portland cement concrete paving.
- Provide recommendations for earthwork and grading.

The assessment of general site environmental conditions for the presence of contaminants in the soils and groundwater of the site was beyond the scope of this investigation.

Our recommendations are based on the results of our current and previous field explorations, laboratory tests, and appropriate engineering analyses. The results of the current field exploration and laboratory tests, which, together with the data obtained during our previous investigations, form the basis of our recommendations, are presented in Appendix A.

Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable geotechnical consultants practicing in this or similar localities. No other warranty, express or implied, is made as to the professional advice included in this report. This report has been prepared for Los Angeles Unified School District and their design consultants to be used solely for the proposed school modernization project. This report has not been prepared for use by other parties, and may not contain sufficient information for purpose of other parties or other uses.

2.0 PROJECT DESCRIPTION AND SITE CONDITIONS

The proposed modernization is planned to consist of the construction of several buildings at the site, as shown on Figure 2. Several existing structures will be demolished in order to accommodate the new construction. The remaining existing classroom buildings are planned to evaluated and modernized. The new buildings planned include an Administration Building, Library & Classroom Building, a Science & General Classroom Building, a lunch shelter, two Toilet Buildings, a Gymnasium Building, and an Auditorium & Performing Arts Building. The exact configuration of the new construction is still under development and will ultimately be determined by the selected design-build team(s).

No subterranean construction is anticipated; the lowest finished floor elevations of new structures are anticipated to be at about the existing grade. Structural loading information is not available for the proposed buildings. The buildings are anticipated to be one- to two-stories in height; accordingly, for the purposes of this report, we have assumed that the dead-plus-live column loads will not exceed approximately 200 kips.

The Francis Polytechnic Senior High School campus covers approximately 45 acres and consist of numerous structures (both permanent buildings and modular classroom buildings). The campus is mostly paved with asphalt with some landscape areas. The ground surface of the campus is relatively flat and various underground utilities cross the campus, including those associated with a methane detection system installed due to the proximity to the former Sheldon-Arleta Landfill located immediately to the northwest of the campus.

3.0 EXPLORATIONS AND LABORATORY TESTS

The soil conditions beneath the site were recently explored by drilling 10 borings to depths of 31 to 51 feet below the existing grade at the locations shown on Figure 2. In addition to the exploration borings, eight borings were drilled to depths of 15 to 20 feet below the existing grade for the purpose of determining the infiltration rate of the subsurface soils; the locations of these borings are also shown on Figure 2. Data were also available from borings drilled as part of our previous preliminary geotechnical investigation for the proposed modernization; the locations of these borings are also shown on Figure 2. Details of our current explorations and the logs of the exploration borings and infiltration test borings are presented in Appendix A. The results of our prior explorations on the campus are presented in Appendix B.

Laboratory tests were performed on selected samples obtained from our field exploration to aid in the classification of the soils and to determine the pertinent engineering properties of the foundation soils. The following tests were performed:

- Moisture content and dry density determinations.
- Fines content.
- Direct shear.
- Consolidation.
- Hydroconsolidation.
- Grain size distribution.
- Stabilometer (R-value).
- Corrosivity.

All testing was performed in general accordance with applicable ASTM specifications at the time of testing. Details of our current laboratory testing program and test results are presented in Appendix A. The results of our prior laboratory testing are presented in Appendix B.

In addition to the geotechnical laboratory testing described above, as requested, agricultural soil testing was also performed on samples obtained from our exploratory borings. The testing was performed for us by A&L Western Agricultural Laboratories. The results of the tests are presented in Appendix C.

4.0 SOIL CONDITIONS

Fill soils, up to 5½ feet thick, were encountered in our recent borings. The fill soils encountered in our borings consisted primarily of combinations of silty sand and sand with some gravel and were not uniformly well compacted. Deeper fill could occur between borings and in other unexplored areas, particularly in areas where existing buildings and utilities are present.

The natural soils underlying the fill consist of silty sand at some locations within approximately the upper 5 feet. The fill and natural silty sand is underlain by predominantly medium dense to very dense well-graded sand with gravel and cobbles and poorly graded sand. The upper silty sand soils may be somewhat susceptible to hydroconsolidation and may become somewhat weaker and more compressible when wet.

Groundwater was not encountered within the maximum 50-foot depth explored by our borings. Based on the Seismic Hazard Zone Report for the Van Nuys 7.5-Minute Quadrangle published by the California Division of Mines and Geology (CDMG, 1997), the historic-high groundwater level is at a depth of approximately 140 feet beneath the existing ground surface at the site.

The corrosion tests indicate that the on-site soils are moderately corrosive to ferrous metals, aggressive to copper, and that the potential for sulfate attack on portland cement concrete is considered negligible.

5.0 GEOLOGY

5.1 GEOLOGIC SETTING

The site is located in the eastern portion of the San Fernando Valley. The San Fernando Valley is an elliptical-shaped alluvium-filled basin, approximately 23 miles wide and 12 miles long, formed by deposition from streams and rivers that have transported sediments from the surrounding upland areas. The alluvium is mainly derived from the Santa Monica Mountains to the south, the Santa Susana Mountains to the northwest, the Simi Hills to the west, the San Gabriel Mountains to the northeast, and the Verdugo Mountains to the east.

Regionally, the site is located in the Transverse Ranges geomorphic province. This province is characterized by east-west trending geologic structures that include the east-west trending Santa Monica Mountains and the east-west trending active San Fernando fault zone. The trend of the San Fernando Valley reflects the overall trend of the Transverse Ranges, where major structural features exhibit an east-west orientation in contrast to the northwest-southeast trend that dominates in the rest of California. The San Fernando Valley is an area of compression between the San Gabriel Mountains on the northeast and the Santa Monica Mountains on the south. The east-west trend is reflected by the nearby San Fernando fault zone located approximately 4.4 miles to the north-northeast.

The site in relation to topographic features is depicted in Figure 1, Vicinity Map. The relationship of the site to the local geologic conditions is depicted in Figure 3, Local Geologic Map. Figure 4, Regional Geologic Map, shows the geology of the area on a regional scale. The location of major faults and earthquake epicenters in Southern California are shown on Figure 5, Regional Fault and Seismicity Map.

5.2 GEOLOGIC MATERIALS

Based on the materials encountered in our exploration borings, the site is locally mantled with artificial fill to a depth of 5½ feet. Deeper and undocumented fill may be encountered between borings due to prior grading. The fill consists primarily of silty sand and sand with silt and gravel, and is underlain by late Pleistocene- to Holocene-age alluvial deposits. As

encountered in our current and prior borings drilled at the campus, the alluvial deposits generally consist of poorly graded to well graded sand with varying amounts of gravel and cobbles. Below approximately 35 feet below ground surface (bgs), the sand deposits generally decrease in gravel content and increase slightly in silt content. The sandy deposits are generally medium dense to very dense.

5.3 GROUNDWATER

The site is located in the San Fernando Valley Groundwater Basin of the South Coast Hydrologic Region according to the California Department of Water Resources (DWR, 2003). According to the California Geological Survey (CGS), formerly the California Division of Mines and Geology (CDMG), the historical high groundwater level in the area is approximately 140 feet bgs (CDMG, 1997). Water level measurements for Los Angeles County Well No. 4897, located 0.1 mile northwest of the site, indicate the most recent measured depth to groundwater was 328.8 feet bgs on December 3, 2009 (County of Los Angeles, 2016). This depth corresponds to a water surface elevation of 488.2 feet above mean sea level (MSL). The shallowest water recorded in this well was measured on August 3, 1993 with a depth of 186.9 and corresponding water surface elevation of 630.1 feet above MSL. This has recorded groundwater levels from 1958 to 2009.

Groundwater was not encountered in our borings, which were drilled to a maximum depth of 51 feet bgs.

5.4 FAULTS

The numerous faults in Southern California include active, potentially active, and inactive faults. The criteria for these major groups are based on criteria developed by the CGS for the Alquist-Priolo Earthquake Fault Zoning Program (Bryant and Hart, 2007). By definition, an active fault is one that has had surface displacement within Holocene time (about the last 11,700 years). A potentially active fault is a fault that has demonstrated surface displacement of Quaternary age deposits (last 1.6 million years). Inactive faults have not moved in the last 1.6 million years. A list of nearby active faults and the distance in miles between the site and the nearest point on the fault, the maximum magnitude, and

the slip rate for the fault is given in Table 1. A similar list for potentially active faults is presented in Table 2. The faults in the vicinity of the site are shown in Figure 5, Regional Faults and Seismicity Map.

Active Faults

Verdugo Fault Zone

The closest active fault to the site, the Verdugo fault zone, is composed of several faults including the Verdugo fault, the San Rafael fault, and the Eagle Rock fault. The Verdugo fault is located approximately 1.3 miles northeast of the site. The most recent documented activity along this fault occurs in the Holocene age alluvial deposits along the western flank of the Verdugo Mountains in the Burbank area (County of Los Angeles Seismic Safety Element, 1990). Additionally, this portion of the fault is considered active by the State (Jennings and Bryant, 2010). An Alquist-Priolo Earthquake Fault Zone has not been established for the Verdugo fault by the State. According to the CGS, the Verdugo fault is capable of a magnitude 6.9 (M_w) earthquake and has a slip rate of 0.4 millimeters per year (Cao et al., 2003; Field et al., 2013).

San Fernando Fault Zone

The active Mission Wells segment of the San Fernando fault zone, located approximately 4.4 miles to the north-northeast. The San Fernando fault zone comprises one of a number of left lateral/reverse frontal faults bounding the southern margin of the San Gabriel and Santa Susana Mountains. An earthquake of magnitude 6.6 occurred along this fault zone on February 9, 1971. Surface rupture occurred along the Tujunga, Sylmar, and Mission Wells segments of the San Fernando fault zone during this earthquake. According to Cao et al., 2003, and Field et al., 2013, the San Fernando fault is capable of a magnitude 6.7 (M_w) earthquake and has a slip rate of 2.0 millimeters per year.

Santa Susana Fault

The active Santa Susana fault is part of the larger frontal Sierra Madre Fault Zone and is located approximately 6.9 miles north of the site. This fault extends northeastward from the Santa Susana Mountains across San Fernando Pass and into the San Gabriel

Mountains dipping about 80° to the north. Most of the fault is poorly exposed due to the low angle fault plane and extensive landsliding. According to the CGS, the Santa Susana is capable of a magnitude 6.7 (M_w) and has a slip rate of 6.0 millimeters per year (Cao et al., 2003; Field et al., 2013).

Sierra Madre Fault Zone

The active Sierra Madre fault is located 7.3 miles east-northeast of the proposed site. This fault zone borders the southern front of the San Gabriel Mountains and consists of a series of discontinuous reverse faults that separate pre-Tertiary crystalline rocks on the north from Tertiary and Quaternary sedimentary deposits on the south. The various faults exhibit northerly dips from 15 degrees to vertical, with the crystalline rocks thrust upward toward the south over sediments as young as mid-Pleistocene age. The Sierra Madre fault zone extends approximately 50 miles along the southern flank of the San Gabriel Mountains from Big Tujunga Canyon on the west to Cajon Pass on the east. The fault zone, which includes the active Cucamonga fault, consists of a series of reverse fault segments that are believed to have been active at different times in the geologic past (Crook et al., 1987). The moderate M5.8 1991 Sierra Madre earthquake is believed to be a result of movement on a small portion of the Sierra Madre fault zone. Recent paleoseismic investigations by Rubin et al. (1998) in Altadena have shown that the Sierra Madre fault fails in large, infrequent earthquakes. The past two ruptures in Altadena produced about 4.5 to 5 m of slip at the ground surface and occurred within the past ~18,000 years. Farther east in San Dimas, Tucker and Dolan (2001) documented the occurrence of two large-slip earthquakes during the period between ~8,000 and ~24,000 years ago. The most recent event on the eastern portion of the Sierra Madre fault zone occurred prior to ~8,000 years ago. The CGS considers the Sierra Madre fault to be capable of a magnitude 7.2 (M_w) earthquake and estimates an annual slip rate of 2 millimeters per year (Cao et al. 2003; Field et al. 2013).

San Gabriel Fault Zone

The active San Gabriel fault zone is located about 8.5 north-northeast of the site. This fault zone extends southeasterly approximately 80 miles from near Bear Mountain in Ventura County to San Antonio Canyon in San Bernardino County (Weber, 1982).

Estimates of approximately 6 miles of right lateral displacement of total offset along the fault zone have been made (Weber, 1982). The Saugus-Newhall segment of the San Gabriel fault zone is included within an Alquist-Priolo Earthquake Fault Zone. According to Cao et al., 2003 and Field et al., 2013, the San Gabriel fault is capable of a magnitude 7.2 (M_w) earthquake and has a slip rate of 0.4 millimeters per year.

Hollywood Fault

The active Hollywood fault approximately trends east-west along the base of the Santa Monica Mountains from the West Beverly Hills Lineament in the West Hollywood-Beverly Hills area (Dolan and Sieh, 1992) to the Los Feliz area of Los Angeles. The Hollywood fault zone is approximately 8.6 miles south-southeast of the site. The fault is a groundwater barrier within Holocene sediments (Converse et al., 1981). Studies by several investigators (Dolan et al., 2000a; Dolan et al., 1997; Dolan and Sieh, 1992; and Crook and Proctor, 1992) have indicated that the fault is active, based on geomorphic evidence, stratigraphic correlation between exploratory borings, and fault trenching studies. As of November 6, 2014, the Hollywood fault zone within the Hollywood 7.5 minute quadrangle has been included in an Earthquake Fault Zone by the CGS (CGS, 2014).

Until recently, the approximately 15 kilometer-long Hollywood fault zone was considered to be expressed as a series of linear scarps and faceted south-facing ridges along the south margin of the eastern Santa Monica Mountains and the Hollywood Hills. Multiple recent fault rupture hazard investigations have shown that the Hollywood fault zone is located south of the faceted ridges and bedrock outcrops along Sunset Boulevard (Harza, 1998, William Lettis & Associates, 1998). Active deposition of numerous small alluvial fans at the mountain front and a lack of fan incision suggest late Quaternary uplift of the Santa Monica Mountains along the Hollywood fault zone (Dolan et al., 2000b, Dolan et al., 1997, Dolan and Seih, 1992, Crook et al., 1983). The fault dips steeply to the north and has juxtaposed Tertiary and Cretaceous age rocks over young sedimentary deposits of the northern Los Angeles basin. The Hollywood fault zone has not produced any damaging earthquakes during the historical period and has had relatively minor micro-seismic activity. An average slip rate of 0.9 mm/yr and a maximum magnitude of 6.4 (M_w) are estimated by the CGS (Cao et al., 2003; Field et al., 2013) for the Hollywood fault.

Newport-Inglewood Fault Zone

The Newport-Inglewood fault zone is located zone is located about 9.9 miles south-southwest of the site. The Newport-Inglewood fault zone is composed of a series of discontinuous northwest-trending en echelon faults extending from Ballona Gap southeastward to the area offshore from Newport Beach. The Newport-Inglewood fault zone is reflected at the surface by a line of geomorphically young anticlinal hills and mesas formed by the folding and faulting of a thick sequence of Pleistocene age sediments and Tertiary age sedimentary rocks (Barrows, 1974). Fault-plane solutions for 39 small earthquakes (between 1977 and 1985) show mostly strike-slip faulting with some reverse faulting along the north section (north of Dominguez Hills) and some normal faulting along the south section (south of Dominguez Hills to Newport Beach) (Hauksson, 1987). Investigations by Law/Crandall (1993) in the Huntington Beach area indicate that the North Branch section of the Newport-Inglewood fault zone offsets Holocene age alluvial deposits in the vicinity of the Santa Ana River. An average slip rate of 1.0 mm/yr and a maximum magnitude of 7.1 (M_w) are estimated by the CGS (Cao et al., 2003; Field et al., 2013) for the Newport-Inglewood fault.

Raymond Fault

The Raymond fault located approximately 11 miles southeast of the site. The fault is primarily a left-lateral strike-slip fault with a minor component of high-angle reverse offset, placing basement rocks north of the fault over alluvial sediments south of the fault. The Raymond fault has long been recognized as a groundwater barrier in the Pasadena/San Marino area and numerous geomorphic features along its entire length (such as fault scarps, sag ponds, springs, and pressure ridges) attest to the fault's activity during the Holocene epoch (last 11,700 years). Within the last 36,000 to 41,000 years, five to eight separate earthquake events have been recognized along the Raymond fault (Crook et al., 1987, Weaver and Dolan, 2000). The most recent fault movement, based on radiocarbon ages from materials collected in an excavation exposing the fault, occurred sometime between 2,160 ± 105 and 1,630 ± 100 years before present (LeRoy Crandall and Associates, 1978; Crook et al., 1987; Weaver and Dolan, 2000). An average slip rate of 2.0 mm/yr and a maximum moment magnitude of 6.5 (M_w) are estimated by the CGS (Cao et al., 2003; Field et al., 2013) for the Raymond fault.

Santa Monica Fault

The north strand of the Santa Monica fault, a left lateral, reverse oblique slip fault, is located approximately 11 miles south of the project site. The Santa Monica and Hollywood fault zones form a portion of the Transverse Ranges Southern Boundary fault system. The Transverse Ranges Southern Boundary fault system also includes the Malibu Coast-Anacapa-Dume faults to the west of the Santa Monica fault and the Raymond and Cucamonga faults to the east of the Hollywood fault (Dolan et al., 2000). The Santa Monica fault zone is the western segment of the Santa Monica-Hollywood fault zone. The fault zone trends east - west from the Santa Monica coastline on the west to the Hollywood area on the east. Urbanization and development within the greater Los Angeles area has resulted in a poor understanding of the lateral extent, location, and rupture history of the Santa Monica fault zone. However, the surface expression of the Santa Monica fault zone includes fault-related geomorphic features, offset stratigraphy, and ground water barriers within late Quaternary deposits (Hill et al., 1979, and Dolan et al., 2000).

Although the Santa Monica fault is considered active, it has not yet been included in an Alquist-Priolo Earthquake Fault Zone, however, it is expected to be zoned in the near future. An average slip rate of 1.0 mm/yr and a maximum magnitude of 6.6 (M_w) are estimated by the CGS (Cao et al., 2003; Field et al., 2013) for the Santa Monica fault.

Simi-Santa Rosa Fault Zone

The active Simi fault of the Simi-Santa Rosa fault zone is located about 12 miles west-northwest of the site. The Simi fault is a left-oblique reverse fault within the Simi-Santa Rosa fault zone, a series of north dipping reverse faults (Hitchcock, et al., 2001). There have been no historic earthquakes associated with this fault. However, investigation (Hitchcock, et al. 2001) demonstrates faulting and warping of Holocene sediments. The CGS considers the Simi fault to be active and has established an Alquist-Priolo Earthquake Fault Zone for the fault. According to the CGS, the Simi-Santa Rosa fault zone is capable of a moment magnitude 7.0 (M_w) earthquake and has a slip rate of 0.7 millimeters per year (Cao et al., 2003; Field et al., 2013).

San Andreas Fault Zone

The Mojave section of the active San Andreas fault zone is located about 27 miles north-northeast of the site. This fault zone, California's most prominent geological feature, trends generally northwest for almost the entire length of the state. The 1857 Fort Tejon earthquake was the last major earthquake along the San Andreas fault zone in Southern California. According to the CGS, the Mojave section of the San Andreas fault is capable of a magnitude 7.4 (M_w) earthquake and has a slip rate of 34 millimeters per year (Cao et al., 2003; Field et al., 2013).

Blind Thrust Faults

Several buried thrust faults, commonly referred to as blind thrusts, underlie the Los Angeles Basin at depth. These faults are not exposed at the ground surface and are typically identified at depths greater than 3 kilometers. These faults do not present a potential surface fault rupture hazard. However, the following described blind thrust faults are considered active and potential sources of future earthquakes.

Northridge Thrust

The Northridge Thrust, as defined by Petersen et al. (1996), is a deep thrust fault that is considered the eastern extension of the Oak Ridge fault. The Northridge Thrust is located beneath the majority of the San Fernando Valley and was the causative fault of the January 17, 1994, magnitude 6.7 (M_w) Northridge earthquake. This thrust fault is not exposed at the surface and does not present a potential surface fault rupture hazard. However, the Northridge Thrust is an active feature that can generate future earthquakes. The closet point to the surface projection of the Northridge Thrust fault is approximately 1 mile west-northwest (WGCEP, 2016). According to the CGS, the Northridge Thrust is capable of a magnitude 7.0 (M_w) earthquake and has a slip rate of 1.5 millimeters per year (Cao et al., 2003; Field et al., 2013)

Compton Thrust

The Compton blind thrust has been defined from seismic reflection profiles and borehole data (Leon et al., 2009) as a northeast-dipping structure. This blind thrust fault system extends approximately 28 miles from southwest Los Angeles County to northern Orange County in a southeastern direction. Leon et al. (2009) has correlated blind faulting at depth to near-surface folding. Several uplift events have been observed by investigating deformed Holocene layers along buried fold scarps. The cumulative uplift from the observed events ranged from 2 to 6 feet or approximately 4 to 14 feet of thrust displacement with magnitudes (M_w) of 7.0 to 7.4 (Leon et al., 2009). Slip rate is estimated to be 0.9 mm/yr (Field et al., 2013). The closet point to the surface projection of the Compton Thrust fault is approximately 2.8 miles west-southwest (WGCEP, 2016).

Upper Elysian Park

The Upper Elysian Park fault is a blind thrust fault that overlies the Los Angeles and Santa Fe Springs segments of the Puente Hills Thrust (Oskin et al., 2000 and Shaw et al., 2002). The eastern edge of the Upper Elysian Park fault is defined by the northwest-trending Whittier fault zone. The vertical surface projection of the Upper Elysian Park fault is located about 8 miles east-southeast of the site (WGCEP, 2016). Like other blind thrust faults in the Los Angeles area, the Upper Elysian Park fault is not exposed at the surface and does not present a potential surface rupture hazard; however, the Upper Elysian Park fault is considered an active feature capable of generating future earthquakes. An average slip rate of 1.9 mm/yr and a moment magnitude of 6.4 ($M_{w)}$ are estimated by the CGS for the Upper Elysian Park fault (Cao et al., 2003; Field et al., 2013).

Puente Hills Blind Thrust

The Puente Hills Blind Thrust (PHBT) is defined based on seismic reflection profiles, petroleum well data, and precisely located seismicity (Shaw et al., 2002). This blind thrust extends eastward from downtown Los Angeles to Brea (in northern Orange County). The PHBT includes three north-dipping segments, named from east to west as the Coyote Hills segment, the Santa Fe Springs segment, and the Los Angeles segment. These segments are overlain by folds expressed at the surface as the Coyote Hills, Santa Fe Springs Anticline, and the Montebello Hills. The Santa Fe Springs segment of the PHBT

was the causative fault of the October 1, 1987 Whittier Narrows Earthquake (Shaw et al., 2002). The PHBT is located about 8.2 miles east-southeast of the site at its closest point projected to the surface (WGCEP, 2016). Postulated earthquake scenarios for the PHBT include single segment fault ruptures capable of producing an earthquake of magnitude 6.5 to 6.6 (M_w) and a multiple segment fault rupture capable of producing an earthquake of magnitude 7.1 (M_w). The PHBT is not exposed at the ground surface and does not present a potential for surface fault rupture. However, based on deformation of late Quaternary age sediments above this fault system and the occurrence of the Whittier Narrows earthquake, the PHBT is considered an active fault capable of generating future earthquakes beneath the Los Angeles Basin. An average slip rate of 0.9 mm/yr and a magnitude of 7.1 (M_w) are estimated by the CGS for the PHBT (CGS Cao et al., 2003 and Field et al., 2013).

Potentially Active Faults

Northridge Hills Fault

The closest potentially active fault to the site is the Northridge Hills fault located approximately 3.6 miles west-northwest. The Northridge Hills fault is a reverse fault and its location is based primarily on the numerous oil test holes that have been drilled in the Northridge Hills. Geomorphic evidence, such as scarps in the Pleistocene age alluvial deposits, has been identified on aerial photographs (Weber, 1980). A paleoseismic study (Baldwin et al., 2000) found evidence of monoclonal warping of relatively young (early Holocene to late Pleistocene) shallow surficial deposits. Their borehole data suggest that an unconformity developed on the Plio-Pleistocene Saugus Formation is warped into a south-facing monocline with 13 $\pm$ 2 meters of vertical separation. Evidence of surface rupture was not observed. They suggest the fault could be seismogenic, producing earthquakes of magnitude 6.0 to 6.4 (M_w), as well as undergoing secondary deformation during and/or following large magnitude earthquakes on nearby structures, such as the Northridge blind thrust.

Mission Hills Fault

The potentially active Mission Hills fault is a 6.2 mile long reverse fault in the northern San Fernando Valley extending from Pacoima to Granada Hills. It is postulated that the fault has ruptured in the late Quaternary, and possibly as recent as the Holocene. A slip rate of 0.5 mm/yr has been approximated (Southern California Earthquake Center, 2015). The Mission Hills fault is approximately 4.9 miles northwest of the site.

Chatsworth Fault

The potentially active Chatsworth fault is a 12 mile long reverse fault in the western San Fernando Valley. The fault runs northeasterly from Bell Canyon towards Chatsworth. It is north dipping and capable of a magnitude 6.0 to 6.8 ($M_{w)}$ earthquake (Southern California Earthquake Center, 2016). The Chatsworth fault is approximately 11 miles west-northwest of the site.

5.5 GEOLOGIC-SEISMIC HAZARDS

Fault Rupture

The site is not within a currently established Alquist-Priolo Earthquake Fault Zone for surface fault rupture hazards. The closest active fault to the site with the potential for surface fault rupture is the Verdugo fault zone, is located approximately 1.3 miles northeast of the site. The closest Alquist-Priolo Earthquake Fault Zone, established for a portion San Fernando fault zone, is located approximately 4.4 miles north-northeast of the site.

Based on the available geologic data, active or potentially active faults with the potential for surface fault rupture are not known to be located directly beneath or projecting toward the site. Therefore, the potential for surface rupture due to fault plane displacement propagating to the surface at the site during the design life of the proposed development is considered low.

Seismicity

Earthquake Catalog Data

The seismicity of the region surrounding the site was determined from research of an electronic database of seismic data (Southern California Seismographic Network, 2015). This database includes earthquake data compiled by the California Institute of Technology from 1932 through 2015 and data for 1812 to 1931 compiled by Richter and the U.S. National Oceanic Atmospheric Administration (NOAA). The search for earthquakes that occurred within 100 kilometers of the site indicates that 469 earthquakes of magnitude 4.0 and greater occurred from 1932 through 2016; 1 earthquake of magnitude 6.0 or greater occurred between 1906 and 1931; and 1 earthquakes of magnitude 7.0 or greater occurred between 1812 and 1905. A list of these earthquakes is presented as Table 3. Epicenters of moderate and major earthquakes (greater than magnitude 5.0) are shown in Figure 5, Regional Faults and Seismicity Map.

The information for each earthquake includes date and time in Greenwich Civil Time (GCT), location of the epicenter in latitude and longitude, quality of epicentral determination (Q), depth in kilometers, distance from the site in kilometers, and magnitude. Where a depth of 0.0 is given, the solution was based on an assumed 16-kilometer focal depth. The explanation of the letter code for the quality factor of the data is presented on the first page of the table.

Historic Earthquakes

A number of earthquakes of moderate to major magnitude have occurred in the Southern California area within the last 84 years. A partial list of these earthquakes is included in the following table.

List of Historic Earthquakes

Earthquake (Oldest to Youngest)	Date of Earthquake	Magnitude	Distance to Epicenter (miles)	Direction to Epicenter
Long Beach	11-Mar-33	6.4	48	SE
Tehachapi	21-Jul-52	7.5	64	NW
San Fernando	9-Feb-71	6.6	13	NNE
Whittier Narrows	1-Oct-87	5.9	22	SE

Sierra Madre	28-Jun-91	5.8	24	E
Landers	28-Jun-92	7.3	112	ESE
Big Bear	28-Jun-92	6.4	90	ESE
Northridge	17-Jan-94	6.7	7	W
Hector Mine	16-Oct-99	7.1	125	NE
Sierra El Mayor	4-Apr-10	7.2	239	SE
La Habra	28-Mar-14	5.1	34	SE
Borrego Springs	10-Jun-16	5.2	136	SE

The site is located in an area that has historically experienced strong ground shaking (as a result of the 1971 San Fernando and the 1994 Northridge Earthquakes) and could experience strong ground shaking in the future. However, this hazard is common in Southern California and the effects of ground shaking can be mitigated by proper engineering design and construction in conformance with current building codes and engineering practices.

Slope Stability

The relatively flat-lying topography at the site precludes both stability problems and the potential for lurching (earth movement at right angles to a cliff or steep slope during ground shaking). According to the County of Los Angeles Seismic Safety Element (1990) and the City of Los Angeles Safety Element (1996), the site is not within an area identified as having a potential for slope instability. There are no known landslides near the site, nor is the site in the path of any known or potential landslides. Additionally, the site is not located within an area identified as having a potential for seismic slope instability (CDMG, 1998).

Liquefaction and Seismic-Induced Settlement

Liquefaction potential is greatest where the groundwater level is shallow, and submerged loose, fine sands occur within a depth of about 50 feet or less. Liquefaction potential decreases as grain size and clay and gravel content increase. As ground acceleration and shaking duration increase during an earthquake, liquefaction potential increases.

According to the County of Los Angeles 2014 Draft Seismic Safety Element (2014), the City of Los Angeles (2015), and the CGS (CDMG, 1998), the site is not within an area identified as having a potential for liquefaction. Based on groundwater level

measurements in nearby wells, groundwater has historically been at a depth greater than 100 feet. Therefore, the potential for liquefaction and the associated ground deformation beneath the site is considered to be low.

Seismically-induced settlement is often caused by loose to medium-dense granular soils densified during ground shaking. Uniform settlement beneath a given structure would cause minimal damage; however, because of variations in distribution, density, and confining conditions of the soils, seismically-induced settlement is generally non-uniform and can cause serious structural damage. Dry and partially saturated soils as well as saturated granular soils are subject to seismically-induced settlement. To evaluate the site-specific potential for seismically-induced settlement above the historic-high groundwater level, we have computed the geometric mean peak ground acceleration (PGA) for the maximum considered earthquake, which is consistent with the requirements of the 2016 CBC and ASCE 7-10 for liquefaction evaluations. This ground motion was corrected to be compatible with a Magnitude 7.5 earthquake. The Magnitude 7.5-compatible PGA computed in this manner for the subject site is 0.61g for the maximum considered earthquake.

We have computed the potential for seismically-induced settlement above the postulated historic-high groundwater level in accordance with the methodology of Tokimatsu and Seed (1987) using the results of the Standard Penetration Tests (SPTs) performed in our borings performed at the site. Based on the results of our analyses, we estimate that the seismically-induced settlement could be on the order of ½ inch or less beneath the site in the event of the maximum considered earthquake. Differential seismically-induced settlement is estimated to be on the order of ¼ inch or less.

Tsunamis, Inundation, Seiches, and Flooding

The site is not within a coastal area at a median elevation of 828 feet above mean sea level (NAVD 88). Therefore, tsunamis (seismic sea waves) are not considered a hazard at the site.

According to the Safety Element of the City of Los Angeles (1996) and the Los Angeles County Safety Element (1990), the site is located within a potential dam inundation area

for the Hansen Flood Control Basin. The site could be adversely affected in the event of an earthquake-induced dam failure or seiche (wave oscillations in an enclosed or semi-enclosed body of water). However, this dam, as well as others in California, is continually monitored by various governmental agencies (such as the State of California Division of Safety of Dams and the U.S. Army Corps of Engineers) to guard against the threat of dam failure. Therefore, the potential for inundation at the site as a result of an earthquake-induced dam failure is considered low.

The site is located outside the 0.2% annual chance flood (Zone X) as designated by the Federal Emergency Management Association (FEMA, 2008). Therefore, the potential for flooding to affect the site is considered low.

Subsidence

The site is not within an area of known subsidence associated with fluid withdrawal (groundwater or petroleum), peat oxidation, or hydrocompaction.

Oil Wells

The site is not located within the limits of an oil field according to the well finder system of the California Division of Gas and Geothermal Resources (DOGGR, 2016). Plugged and abandoned oil exploration holes are not known to be located near the site; however, there is a remote possibility that undocumented wells could be encountered during construction. According to DOGGR, the closest known oil production well is approximately 3 miles southeast of the site; the well is categorized as “active producer.” Any well encountered would need to be properly abandoned in accordance with the current requirements of DOGGR.

Methane Gas

According to the City of Los Angeles (2016), the site is located within a Methane Zone due to its proximity to the former Sheldon-Arleta Landfill. Therefore, there is a potential for methane and other volatile gases to occur beneath the site. For any new structures, a subsurface methane investigation would be required and if testing indicates that methane

is present at the site, then a permanent methane gas control system may be necessary beneath proposed buildings at the site.

Volcanic Eruption

The site is not located in an area of recent volcanism. Therefore, the potential for volcanic activity is low.

Radon Gas

According to the CGS, the site is located in an area of low potential for indoor radon levels above 4.0 picocuries per liter (CGS, 2005). Therefore, the potential for radon gas to be encountered is low.

Naturally Occurring Asbestos

The site is not located in an area of naturally occurring asbestos (CGS, 2011).

5.6 GEOLOGIC CONCLUSIONS

Based on the available geologic data, active or potentially active faults with the potential for surface fault rupture are not known to be located directly beneath or projecting toward the site. Therefore, the potential for surface rupture due to fault plane displacement propagating to the surface at the site during the design life of the proposed project is considered low. The site could be subjected to strong ground shaking in the event of an earthquake, this hazard is common in Southern California and the effects of ground shaking can be mitigated by proper engineering design and construction in conformance with current building codes and engineering practices.

The relatively flat-lying topography at the site precludes both stability problems and the potential for lurching (earth movement at right angles to a cliff or steep slope during ground shaking). The school property is within a Methane Zone according to the City of Los Angeles. For any new structures, a subsurface methane investigation would be required and if testing indicates that methane is present at the site, then a permanent methane gas control system may be necessary beneath proposed buildings at the site.

According to the City and County of Los Angeles, the site is within potential dam inundation area. Dams are routinely inspected by state and federal agencies, therefore, the potential for inundation is low. The potential for other geologic-seismic hazards such as liquefaction, tsunamis, seiches, flooding, asbestos, radon gas, and subsidence affecting the site is considered low. We estimate that the seismically-induced settlement could be on the order of ½ inch or less beneath the site in the event of the maximum considered earthquake.

6.0 RECOMMENDATIONS

6.1 GENERAL

Records documenting the placement and compaction of the existing fill soils encountered within the project area are not available; therefore, the existing fill soils are not considered suitable for support of new structures on conventional spread/continuous footings. If the existing fill soils are excavated and replaced as properly compacted fill soils, the planned structures may be supported on conventional spread/continuous footings established on properly compacted fill soils and/or undisturbed natural soils and the floor slabs may be supported on grade. If the footings are established in the undisturbed natural well-graded or poorly graded sand materials, which may require deepening in some locations, a higher bearing value may be used in the design. The deepening of the footings could be accomplished by excavating the footing excavations to a greater depth than designed and backfilling the lower portion of the excavation with structural concrete (or sand-cement slurry containing at least 3 sacks of cement per cubic yard) up to the design bottom of footing elevation.

Ideally, to provide support for new paving and other exterior concrete walks and slabs on grade, all existing uncertified fill soils should be removed and replaced as properly compacted fill. However, if the risk of some settlement and greater than normal future maintenance is acceptable to LAUSD, then the removal of existing uncertified fill soils may be limited to the upper 2 feet beneath the pavement/slab section. However, after the 2-foot removal is completed, the exposed subgrade should be carefully observed by a representative of our firm to identify any soft areas that may require additional excavation and compaction.

We recommend that provisions for positive surface drainage away from foundations be incorporated into the site grading plans. Impoundment of stormwater run-off within the construction area should not be permitted within the immediate vicinity of the foundation construction area. We also recommend avoiding the placement of planters, underground water pipes, or any other source of additional water to the subsurface soils in the immediate vicinity of the foundations. If planter or landscaped areas are desired within 20 feet of the foundations, these areas should have impermeable bottoms. In addition, we

recommend pressure testing of utility lines prior to backfilling to detect and eliminate leaks due to poor workmanship or material defects.

6.2 FOUNDATIONS

Bearing Value

If the existing fill soils are excavated and replaced as properly compacted fill soils, the proposed buildings may be supported on conventional spread/continuous footings underlain by properly compacted fill and/or undisturbed natural soils. Such footings, carried at least 2 feet below the lowest adjacent grade or floor level, may be designed to impose a net dead-plus-live load pressure of 2,500 pounds per square foot.

The above bearing value may also be used for preliminary analyses of existing spread/continuous footing foundations supporting existing campus buildings. If necessary, this value can be further refined/revised based on a review of as-built drawings and/or test pits adjacent to existing foundations for specific existing structures.

Where the footings of a structure are deepened to extend into the undisturbed natural sandy soils, such spread/continuous footings carried at least 2 feet below the lowest adjacent grade or floor level may be designed to impose a net dead-plus-live load pressure of 5,000 pounds per square foot.

The excavations should be deepened as necessary to extend into satisfactory soils. A one-third increase may be used for wind or seismic loads. The recommended bearing values are net values, and the weight of concrete in the footings may be taken as 50 pounds per cubic foot; the weight of soil backfill may be neglected when determining the downward loads.

Settlement

Building settlements will depend on the magnitude of the structural loads. However, it is anticipated that the settlement of new structures, supported on spread footings in the manner recommended above, will be on the order of 1 inch or less with differential settlements on the order of ¼ inch between adjacent columns. The proposed structures

should also be designed to accommodate the dynamic settlement, as discussed previously, in addition to the static settlements given above.

Lateral Resistance

Lateral loads may be resisted by soil friction and by the passive resistance of the soils. A coefficient of friction of 0.4 may be used between the footings and the floor slab and the supporting soils. The passive resistance of the soils may be assumed to be equal to the pressure developed by a fluid with a density of 300 pounds per cubic foot. A one-third increase in the passive value may be used for wind or seismic loads. The frictional resistance and the passive resistance of the soils may be combined without reduction in determining the total lateral resistance.

Ultimate Design Factors

When considering an ultimate design approach, the recommended design values provided in the previous sections may be multiplied by the factors shown:

Design Item	Ultimate Design Factor
Bearing Value	3.0
Passive Pressure	1.5
Coefficient of Friction	1.5

In no event, however, shall foundation sizes be less than those required for dead-plus-live loads when using the working stress design values.

6.3 DYNAMIC SITE CHARACTERISTICS

Mapped Seismic Design Parameters

We have determined the seismic design parameters in accordance with the 2016 CBC and ASCE 7-10 Standard (ASCE, 2010) using the United States Geological Survey (USGS) Seismic Design Maps Web Application. The CBC Site Class was determined to be Site Class “D” based on the results of our explorations and a review of the local soil and geologic conditions. The mapped seismic parameters are presented in the following table:

Parameter	Mapped Value
S_S (0.2 second period, Site Class B)	2.26g
S_1 (1.0 second period, Site Class B)	0.84g
Site Class	D
F_a	1.0
F_v	1.5
$S_{MS} = F_a S_S$ (0.2 second period)	2.26g
$S_{M1} = F_v S_1$ (1.0 second period)	1.26g
$S_{DS} = 2/3 \times S_{MS}$ (0.2 second period)	1.51g
$S_{D1} = 2/3 \times S_{M1}$ (1.0 second period)	0.84g

By: WL 11/7/16, Checked By: MM 11/07/16

Site-Specific Ground Motion Hazard Analysis

We have performed a Probabilistic Seismic Hazard Analyses (PSHA) and a Deterministic Seismic Hazard Analyses (DSHA) using the computer program EZ-FRISK (Risk Engineering, 2014) in order to develop site-specific response spectra in accordance with the 2016 CBC and Chapter 21 of ASCE 7-10. For the DSHA, a composite deterministic response spectrum was compiled from the maximum of the 84th percentile spectral ordinates computed for known nearby faults. In addition to known fault sources, background seismicity was also included in the PSHA. The computed PSHA and DSHA ground motions were converted to maximum direction ground motions using the multiplication factors recommended in Shahi and Baker (2013).

The site-specific probabilistic and deterministic response spectra were developed using the average ground motions obtained from the Next Generation Attenuation (NGA) West1 relationships of Abrahamson and Silva (2008), Boore and Atkinson (2008), Campbell and Bozorgnia (2008), Chiou and Youngs (2008). For all four NGA relationships, we have used an average shear wave velocity in the upper 30 meters equal to 270 meters per second based on a review of the local soil and geologic conditions. We have used a depth to a shear wave velocity of 1,000 meters per second beneath the site ($Z_{1.0}$) of 600 meters and a depth to a shear wave velocity of 2,500 meters per second ($Z_{2.5}$) of 3.5 kilometers based on the available geologic data.

In accordance with Chapter 21 of ASCE 7-10, the probabilistic Risk-Targeted Maximum Considered Earthquake (MCE_R) response spectrum was taken as the maximum direction

response spectrum with a 2% probability of being exceeded in 50 years multiplied by the risk coefficients C_{RS} and C_{R1}. The risk-targeted coefficients, C_{RS} and C_{R1} were taken from Figures 22-17 and 22-18 in ASCE 7-10. The value of C_{RS} was applied for periods less than or equal to 0.2 second, the value of C_{R1} was applied for periods greater than or equal to 1.0 second, and linear interpolation was used to determine the risk coefficient between 0.2 second and 1.0 second. The C_{RS} and C_{R1} values for this project were determined to be 0.992 and 1.004, respectively.

ASCE 7-10 defines the deterministic MCE_R response spectrum as the maximum of the composite deterministic response spectrum and the deterministic lower limit, as defined on Figure 21.2-1 of ASCE 7-10. The site-specific MCE_R response spectrum was then taken as a composite of the probabilistic and deterministic MCE_R response spectra, determined as described above, which consisted of the lesser of the spectral ordinates between the two spectra. The 5% damped site-specific MCE_R response spectrum and its components are shown on Figure 6. The site-specific design response spectrum was computed by multiplying the ordinates of the site-specific MCE_R response spectrum by two-thirds, with a lower limit at all periods of 80% of the spectral ordinates of the general design response spectrum determined in accordance with Section 11.4.5 of ASCE 7-10. The 5% damped site-specific design response spectrum and its components are shown on Figure 7. The site-specific MCE_R and design response spectra are presented in digitized form for 5% of critical structural damping in Table 4.

Based on the results of our analyses, the site-specific design acceleration parameters, as defined in Section 21.4 of ASCE 7-10, S_{DS} and S_{D1}, may be taken as 1.29g and 1.09g, respectively, and the site-specific MCE_R acceleration parameters, S_{MS} and S_{M1}, may be taken as 1.93g and 1.63g, respectively.

6.4 FLOOR SLAB SUPPORT

If the subgrade is prepared as recommended in the following section on grading, the building floor slabs may be supported on grade.

Construction activities and exposure to the environment can cause deterioration of the prepared subgrade. Therefore, we recommend that our field representative observe the

condition of the final subgrade soils immediately prior to slab-on-grade construction, and, if necessary, perform further density and moisture content tests to determine the suitability of the final prepared subgrade.

If vinyl or other moisture-sensitive floor covering is planned, we recommend that the floor slab in those areas be underlain by a capillary break consisting of a vapor-retarding membrane over a 4-inch-thick layer of gravel. A 2-inch-thick layer of sand should be placed between the gravel and the membrane to decrease the possibility of damage to the membrane. We suggest the following gradation for the gravel:

Sieve Size	Percent Passing
¾″	90–100
No. 4	0–10
No. 100	0–3

A low-slump concrete should be used to minimize possible curling of the slab. A 2-inch-thick layer of coarse sand should be placed over the vapor retarding membrane to reduce slab curling. If this sand bedding is used, care should be taken during the placement of the concrete to prevent displacement of the sand. The concrete slab should be allowed to cure properly before placing vinyl or other moisture-sensitive floor covering.

6.5 MINOR RETAINING WALLS

Lateral Earth Pressure

For design of cantilevered retaining walls, where the surface of the backfill is level, it may be assumed that drained soils will exert a lateral pressure equal to that developed by a fluid with a density of 30 pounds per cubic foot. In addition to the recommended earth pressure, the walls should be designed to resist any applicable surcharges due to foundation or storage loads.

In addition to the recommended earth pressure, walls adjacent to areas subject to vehicular traffic should be designed to resist a uniform lateral pressure of 100 pounds per square foot, acting as a result of an assumed 300 pounds per square foot surcharge behind the walls due to normal vehicular traffic. If the traffic is kept back at least 10 feet

(or a distance equal to the height of the wall, whichever is less) from the walls, the traffic surcharge may be neglected.

Seismic Lateral Earth Pressure

It is anticipated that any minor retaining walls planned for the project will be less than 6 feet in height. Based on the anticipated wall height, the strength characteristics of the on-site soils, and the design level of ground shaking, it is our opinion that the seismic lateral earth pressures will be negligible.

Drainage

Retaining walls should be designed to resist hydrostatic pressures or be provided with a drain pipe or weepholes. The drain could consist of a 4-inch-diameter perforated pipe placed with perforations down at the base of the wall. The pipe should be sloped at least 2 inches in 100 feet and surrounded by ¾-inch crushed rock or gravel separated from the on-site soils by an appropriate filter fabric. The crushed rock or gravel should have less than 5% passing a No. 200 sieve.

6.6 PAVING

To provide support for paving, the subgrade soils should be prepared as recommended in the following section on grading. Compaction of the subgrade, including trench backfills, to at least 90%, and achieving a firm, hard, and unyielding surface will be important for paving support. The preparation of the paving area subgrade should be done immediately prior to placement of the base course. Proper drainage of the paved areas should be provided since this will reduce moisture infiltration into the subgrade and increase the life of the paving.

To provide data for design of asphalt paving, the R-value of a sample of the upper soils was determined. The test results, which indicate R-values of 57, are presented in Appendix A. The paving sections presented below are also suitable to support emergency vehicle traffic.

Asphalt Concrete Paving

The required paving and base thicknesses will depend on the expected wheel loads and volume of traffic (Traffic Index or TI). Assuming that the paving subgrade will consist of the on-site or comparable soils compacted to at least 90% as recommended, the minimum recommended paving thicknesses are presented in the following table.

Assumed Traffic Index	Asphalt Concrete (Inches)	Base Course (Inches)
4 (Automobile Parking)	3	3
5 (Driveways with Light Truck Traffic)	3	4
6 (Driveways with Heavy Truck Traffic)	4	5

The asphalt paving sections were determined using the Caltrans design method. We can determine the recommended paving and base course thicknesses for other Traffic Indices if required. Careful inspection is recommended to verify that the recommended thicknesses or greater are achieved, and that proper construction procedures are followed.

Portland Cement Concrete Paving

Portland cement concrete paving sections were determined in accordance with procedures developed by the Portland Cement Association. Concrete paving sections for a range of Traffic Indices are presented in the following table. We have assumed that the portland cement concrete will have a compressive strength of at least 3,000 pounds per square inch.

Assumed Traffic Index	Concrete Paving (Inches)	Base Course (Inches)
4 (Automobile Parking)	6½	4
5 (Driveways with Light Truck Traffic)	7	4
6 (Driveways with Heavy Truck Traffic)	7½	4

The paving should be provided with joints at regular intervals no more than 15 feet in each direction. Load transfer devices, such as dowels or keys, are recommended at joints in the paving to reduce possible offsets. The paving sections in the above table have

been developed based on the strength of unreinforced concrete. Steel reinforcing may be added to the paving to reduce cracking and to prolong the life of the paving.

Base Course

The base course should conform to requirements of Section 26 of State of California Department of Transportation Standard Specifications (Caltrans), latest edition, or meet the specifications for untreated base as defined in Section 200-2 of the latest edition of the Standard Specifications for Public Works Construction (Green Book). The base course should be compacted to at least 95% of the maximum dry density obtainable by the ASTM Designation D1557 method of compaction.

6.7 FIELD PERCOLATION TESTING

Test Preparation

Eight borings (Borings P-1 through P-8) were drilled throughout the campus for the purpose of percolation testing at the requested depths. All borings were drilled using 8-inch diameter hollow-stem-auger drilling equipment. As requested, the borings were drilled to a depth of approximately 20 feet below the existing grade; the boring locations are shown on Figure 2. The logs of these borings are included in Appendix A.

Test Setup

Our percolation testing was intended to be performed in general accordance with the "Boring Percolation Test Procedure" outlined in the County of Los Angeles Department of Public Works "Guidelines for Design, Investigation, and Reporting Low Impact Development Stormwater Infiltration." However, based on the soil conditions encountered and the results of initial testing, the test method was modified to comply with the "High Flowrate Percolation Test Procedures" outlined in the same county document.

For each test, the test setup was as follows:

- Drilling a boring to the requested depth;

- Installing a 2-inch diameter pipe (with the lower 5-feet being perforated pipe) with a solid end cap surrounded by well-draining sand;

- The 2-inch diameter solid pipe extended from the top of the test zone to the ground surface in order to direct water from the surface into the test zone.

Test Results

As previously stated, the tests were performed in accordance with guidelines provided by the County of Los Angeles. The infiltration rates obtained from the tests are presented in the table below.

Boring No.	Test Zone (feet)	Infiltration Rate (inches per hour)
P-1	15-20	15.0
P-2	15-20	19.5
P-3	15-20	15.7
P-4	15-20	16.2
P-5	15-20	11.7
P-6	15-20	15.3
P-7	15-20	15.9
P-8	15-20	14.1

Correction Factors

The County of Los Angeles guidelines specify three categories of correction factors that are to be applied to the measured percolation rate in order to determine the design infiltration rate. The correction factors are as follows:

Description	Factor
Test-specific correction factor	CF_t
Correction factor for site variability, number of tests, and thoroughness of subsurface investigation	CF_v
Long-term siltation, plugging, and maintenance	CF_s

The test-specific correction factor, CF_t, has been included in the test result values presented on the preceding page. The site variability factor, CF_v, may be taken as 1.0; the long-term siltation, plugging, and maintenance factor, CF_s, should be determined by the civil engineer based on the county guidelines, type of infiltration facility to be installed, and the planned maintenance program for the facility.

Conclusion and Recommendations

The results of our percolation tests indicate that infiltration is feasible within the soil layers tested. The infiltration system should be designed by the project civil engineer depending on the volume of water expected to be discharged into the infiltration system. Recommendations provided by the governing regulatory agency, including the guidelines provided in the City of Los Angeles Department of Building and Safety Information Bulletin 2014-118, "Guidelines for Storm Water Infiltration," should be followed in selecting locations, designing, installing, and maintaining the infiltration system. All stormwater infiltration facilities should be set back at least 20 feet horizontally from existing and proposed structures and other settlement-sensitive features.

6.8 GRADING

The existing fill soils are not considered suitable for support of floor slabs on grade, paving, other exterior concrete walks and slabs on grade, or new structures on conventional spread/continuous footings. The existing fill soils should be excavated and replaced as properly compacted fill to provide support for structures on spread/continuous footings and for floor slabs on grade.

Ideally, to provide support for new paving and other exterior concrete walks and slabs on grade, all existing uncertified fill soils should be removed and replaced as properly compacted fill. However, if the risk of some settlement and greater than normal future maintenance is acceptable to LAUSD, then the removal of existing uncertified fill soils may be limited to the upper 2 feet beneath the pavement/slab section. However, after the 2-foot removal is completed, the exposed subgrade should be carefully observed by a representative of our firm to identify any soft areas that may require additional excavation and compaction.

All required fill should be uniformly well compacted and observed and tested during placement. The on-site soils may be used in any required fill. Any concrete, steel, and other construction materials and debris from previous construction on the site should be removed prior to grading.

Site Preparation

After the site is cleared and any existing fill soils are excavated as recommended, the exposed natural soils should be carefully observed for the removal of all unsuitable deposits. Next, the exposed soils should be scarified to a depth of 6 inches, brought to near-optimum moisture content, and rolled with heavy compaction equipment. At least the upper 6 inches of the exposed soils should be compacted to at least 90% of the maximum dry density obtainable by the ASTM Designation D1557 method of compaction.

We recommend that provisions for positive surface drainage away from the foundation be incorporated into the site grading plans. Impoundment of stormwater run-off within the construction area should not be permitted within the immediate vicinity of the foundation construction area. We also recommend avoiding the placement of planters, underground water pipes, or any other source of additional water to the subsurface soils in the immediate vicinity of the foundations. If planter or landscaped areas are desired within 20 feet of the foundations, these areas should have impermeable bottoms. In addition, we recommend pressure testing of utility lines prior to backfilling to detect and eliminate leaks due to poor workmanship or material defects.

Excavations and Temporary Slopes

Where excavations are deeper than about 4 feet, the sides of the excavations should be sloped back at 1:1 (horizontal:vertical) or shored for safety. Unshored excavations should not extend below a plane drawn at 1½:1 (horizontal to vertical) extending downward from adjacent existing footings. We would be pleased to present data for design of shoring if required.

Excavations should be observed by personnel of our firm so that any necessary modifications based on variations in the soil conditions can be made. All applicable safety requirements and regulations, including OSHA regulations, should be met.

Compaction

The required fill should be placed in loose lifts not more than 8-inches-thick and compacted. The fill should be compacted to at least 90% of the maximum density obtainable by the ASTM Designation D1557 method of compaction. The moisture content of the on-site soils at the time of compaction should vary no more than 2% below or above optimum moisture content.

Backfill

All required backfill should be mechanically compacted in layers; flooding should not be permitted. Proper compaction of backfill will be necessary to minimize settlement of the backfill and to reduce settlement of overlying slabs and paving. Backfill should be compacted to at least 90% of the maximum dry density obtainable by the ASTM Designation D1557 method of compaction. The on-site soils may be used in the compacted backfill. The exterior grades should be sloped to drain away from the foundations to prevent ponding of water.

Some settlement of the backfill should be expected, and any utilities supported therein should be designed to accept differential settlement, particularly at the points of entry to the buildings. Also, provisions should be made for some settlement of concrete walks supported on backfill.

Material for Fill

The on-site soils, less any debris or organic matter, may be used in the required fills. Cobbles larger than 4 inches in diameter should not be used in the fill. Any required import material should consist of relatively non-expansive soils with an expansion index of less than 35. The imported materials should contain sufficient fines (at least 15% passing the No. 200 sieve) so as to be relatively impermeable and result in a stable subgrade

when compacted. All proposed import materials should be approved by our personnel prior to being placed at the site.

6.9 GEOTECHNICAL OBSERVATION

The reworking of the upper soils and the compaction of all required fill should be observed and tested during placement by a representative of our firm. Our representative should perform at least the following duties:

- Observe the clearing and grubbing operations for proper removal of all unsuitable materials.
- Observe the exposed subgrade in areas to receive fill and in areas where excavation has resulted in the desired finished subgrade. The representative should also observe proofrolling and delineation of areas requiring overexcavation.
- Evaluate the suitability of on-site and import soils for fill placement; collect and submit soil samples for required or recommended laboratory testing where necessary.
- Observe the fill and backfill for uniformity during placement.
- Test backfill for field density and compaction to determine the percentage of compaction achieved during backfill placement.
- Observe and probe foundation materials to confirm that suitable bearing materials are present at the design foundation depths.

The governmental agencies having jurisdiction over the project should be notified prior to commencement of grading so that the necessary grading permits can be obtained and arrangements can be made for required inspection(s). The contractor should be familiar with the inspection requirements of the reviewing agencies.

7.0 BASIS FOR RECOMMENDATIONS

The recommendations provided in this report are based upon our understanding of the described project information and on our interpretation of the data collected during our current and previous subsurface explorations and investigations performed by another firm. We have made our recommendations based upon experience with similar subsurface conditions under similar loading conditions. The recommendations apply to the specific project discussed in this report; therefore, any change in the structure configuration, loads, location, or the site grades should be provided to us so that we can review our conclusions and recommendations and make any necessary modifications.

The recommendations provided in this report are also based upon the assumption that the necessary geotechnical observations and testing during construction will be performed by representatives of our firm. The field observation services are considered a continuation of the geotechnical services and essential to verify that the actual soil conditions are as expected. This also provides for the procedure whereby the client can be advised of unexpected or changed conditions that would require modifications of our original recommendations. In addition, the presence of our representative at the site provides the client with an independent professional opinion regarding the geotechnically-related construction procedures. If another firm is retained for the geotechnical observation services, our professional responsibility and liability would be limited to the extent that we would not be the geotechnical engineer of record.

03-11-1933	06:11:00	33.75 N	118.08 W	C	60	.0	4.4

NOTE: Q IS A FACTOR RELATING THE QUALITY OF EPICENTRAL DETERMINATION

A = +- 1 km horizontal distance; +- 2 km depth
B = +- 2 km horizontal distance; +- 5 km depth
C = +- 5 km horizontal distance; no depth restriction
D = >+- 5 km horizontal distance

Event qualities are highly suspect prior to 1990. Many of these event qualities are based on incomplete information according to Caltech.

11-01-1940	20:00:46	33.63 N	118.20 W	B	68	.0	4.0
11-02-1940	02:58:26	33.78 N	118.42 W	B	49	.0	4.0
01-30-1941	01:34:46	33.97 N	118.05 W	A	43	.0	4.1
03-22-1941	08:22:40	33.52 N	118.10 W	B	83	.0	4.0

NOTE: Q IS A FACTOR RELATING THE QUALITY OF EPICENTRAL DETERMINATION

A = +- 1 km horizontal distance; +- 2 km depth
B = +- 2 km horizontal distance; +- 5 km depth
C = +- 5 km horizontal distance; no depth restriction
D = >+- 5 km horizontal distance

Event qualities are highly suspect prior to 1990. Many of these event qualities are based on incomplete information according to Caltech.

NOTE: Q IS A FACTOR RELATING THE QUALITY OF EPICENTRAL DETERMINATION

A = +- 1 km horizontal distance; +- 2 km depth
B = +- 2 km horizontal distance; +- 5 km depth
C = +- 5 km horizontal distance; no depth restriction
D = >+- 5 km horizontal distance

Event qualities are highly suspect prior to 1990. Many of these event qualities are based on incomplete information according to Caltech.

12-30-2015	01:48:57	34.19 N	117.41 W	A	91	7.0	4.4

NOTE: Q IS A FACTOR RELATING THE QUALITY OF EPICENTRAL DETERMINATION

A = +- 1 km horizontal distance; +- 2 km depth
B = +- 2 km horizontal distance; +- 5 km depth
C = +- 5 km horizontal distance; no depth restriction
D = >+- 5 km horizontal distance

Event qualities are highly suspect prior to 1990. Many of these event qualities are based on incomplete information according to Caltech.

NOTES: Probabilistic MCE$_R$ spectrum was computed for a ground motion level expected to achieve a 1% probability of collapse within a 50 year period.

Deterministic MCE$_R$ spectrum is governed by:
- Magnitude 6.9 earthquake on the Northridge Fault at periods up to 0.4 second.
- Magnitude 6.9 earthquake on the Verdugo Fault at periods larger than 0.4 second.

APPENDIX A

CURRENT FIELD EXPLORATIONS AND LABORATORY TEST RESULTS

APPENDIX A

CURRENT FIELD EXPLORATIONS AND LABORATORY TEST RESULTS

CURRENT FIELD EXPLORATIONS

The soil conditions beneath the site were explored by drilling 10 borings at the locations shown on Figure 2. The borings were drilled to depths of 31 to 51 feet below the existing grade. In addition to the exploration borings, eight borings were drilled to depths of 15 to 20 feet below the existing grade for the purpose of determining the infiltration rate of the subsurface soils; the locations of these borings are also shown on Figure 2. All borings were drilled using truck-mounted 8-inch-diameter hollow stem auger drilling equipment.

The soils encountered were logged by our field technician and undisturbed and bulk samples were obtained for laboratory inspection and testing. The logs of the borings are presented on Figures A-1.1 through A-1.18; the depths at which undisturbed samples were obtained are indicated to the left of the boring logs. The number of blows required to drive the Crandall sampler 12 inches using a 140 pound automatic hammer falling 30 inches is indicated on the logs. In addition to obtaining undisturbed samples, standard penetration tests (SPT) were performed several of the borings; the results of the tests are indicated on the logs. The soils are classified in the accordance with the Unified Soil Classification System described on Figure A-2.

LABORATORY TESTS

Laboratory tests were performed on selected samples obtained from the borings to aid in the classification of the soils and to determine their engineering properties.

The field moisture content and dry density of the soils encountered were determined by performing tests on the undisturbed samples. The results of the tests are shown to the left on the boring logs.

Direct shear tests were performed on selected undisturbed samples to determine the strength of the soils. The tests were performed at near saturation moisture content and at various surcharge pressures. The values determined from the direct shear tests are presented on Figure A-3, Direct Shear Test Data.

Confined consolidation tests were performed on six relatively undisturbed samples to determine the compressibility of the soils. Water was added to the samples during the tests to illustrate the effect of moisture on the compressibility. The results of the tests are presented on Figures A-4.1 through A-4.6, Consolidation Test Data.

The optimum moisture content and maximum dry density of the upper soils were determined by performing a compaction test on two samples. The tests were performed in accordance with the ASTM Designation D1557 method of compaction. The results of the tests are presented on Figure A-5, Compaction Test Data.

Hydroconsolidation test were performed on undisturbed samples to determine the hydroconsolidation potential of the on-site soils. The results of the tests are presented on Figure A-6, Hydroconsolidation Test Data.

To determine the particle size distribution of the soils and to aid in classifying the soils, mechanical analyses were performed on one sample. The results of the mechanical analyses are presented on Figure A-7, Particle Size Distribution.

In addition to the full mechanical analyses, tests to determine the percentage of fines (material passing through a -200 sieve) in selected samples were performed. The results of these tests are presented on the boring logs.

To provide information for paving design, a stabilometer test (“R” value test) was performed on two samples of the upper soils. The tests were performed for us by LaBelle·Marvin Professional Pavement Engineering. The results of the test are presented on Figure A-8.

Soil corrosivity tests were performed on three samples of the on-site soils. The results of the tests are presented on Figures A-9.1 through A-9.3.

BORING 1

DATE DRILLED: September 13, 2016

END OF BORING AT 50 FEET

NOTES:
Groundwater was not encountered. Boring was backfilled with soil cuttings, tamped, and patched with asphalt.

THIS RECORD IS A REASONABLE INTERPRETATION OF SUBSURFACE CONDITIONS AT THE EXPLORATION LOCATION. LATITUDE AND LONGITUDE OF BORING LOCATION SHOWN ON LOGS ARE APPROXIMATE; REFER TO PLOT PLAN FOR MORE ACCURATE LOCATION INFORMATION. SUBSURFACE CONDITIONS AT OTHER LOCATIONS AND AT OTHER TIMES MAY DIFFER. INTERFACES BETWEEN STRATA ARE APPROXIMATE. TRANSITIONS BETWEEN STRATA MAY BE GRADUAL.

ELEVATION (ft)	DEPTH (ft)	MOISTURE (% of dry wt.)	DRY DENSITY (pcf)	BLOW COUNT* (blows/ft)	SAMPLE LOC.		
	0						FILL - SILTY SAND - moist, light brown, fine grained
	5						Becomes fine to medium grained
	10					SW	WELL-GRADED SAND - moist, light gray, fine to coarse grained, some gravel
	15	2.9	116	37			Medium dense, (3% Passing No. 200 Sieve)
	20	2.4	118	54			Becomes dense END OF BORING AT 20 FEET
	25						
	30						
	35						
	40						

NOTES:

Hand augered upper 5 feet to avoid damage to utilities. Groundwater was not encountered. Installation of 2-inch diameter PVC filter and percolation testing was performed at depth between 15 to 20 feet below ground surface at completion of drilling. After completion of percolation testing, boring was backfilled with soil cuttings and tamped.

MAJOR DIVISIONS			GROUP SYMBOLS	TYPICAL NAMES
COARSE GRAINED SOILS (More than 50% of material is LARGER than No. 200 sieve size)	GRAVELS (More than 50% of coarse fraction is LARGER than the No. 4 sieve size)	CLEAN GRAVELS (Little or no fines)	GW	Well graded gravels, gravel - sand mixtures, little or no fines.
			GP	Poorly graded gravels or grave - sand mixtures, little or no fines.
		GRAVELS WITH FINES (Appreciable amount of fines)	GM	Silty gravels, gravel - sand - silt mixtures.
			GC	Clayey gravels, gravel - sand - clay mixtures.
	SANDS (More than 50% of coarse fraction is SMALLER than the No. 4 Sieve Size)	CLEAN SANDS (Little or no fines)	SW	Well graded sands, gravelly sands, little or no fines.
			SP	Poorly graded sands or gravelly sands, little or no fines.
		SANDS WITH FINES (Appreciable amount of fines)	SM	Silty sands, sand - silt mixtures
			SC	Clayey sands, sand - clay mixtures.
FINE GRAINED SOILS (More than 50% of material is SMALLER than No. 200 sieve size)	SILTS AND CLAYS (Liquid limit LESS than 50)		ML	Inorganic silts and very fine sands, rock flour, silty of clayey fine sands or clayey silts and with slight plasticity.
			CL	Inorganic lays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays.
			OL	Organic silts and organic silty clays of low plasticity.
	SILTS AND CLAYS (Liquid limit GREATER than 50)		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts.
			CH	Inorganic clays of high plasticity, fat clays
			OH	Organic clays of medium to high plasticity, organic silts.
HIGHLY ORGANIC SOILS			PT	Peat and other highly organic soils.

Undisturbed Sample		Auger Cuttings	
Standard Penetration Test		Bulk Sample	
Rock Core		Crandall Sampler	
Dilatometer		Pressure Meter	
Packer		No Recovery	
Water Table at time of drilling		Water Table after drilling	

Correlation of Penetration Resistance with Relative Density and Consistency

SAND & GRAVEL		SILT & CLAY	
No. of Blows	Relative Density	No. of Blows	Consistency
0 - 4	Very Loose	0 - 1	Very Soft
5 - 10	Loose	2 - 4	Soft
11 - 30	Medium Dense	5 - 8	Medium Stiff
31 - 50	Dense	9 - 15	Stiff
Over 50	Very Dense	16 - 30	Very Stiff
		Over 30	Hard

BOUNDARY CLASSIFICATIONS Soils possessing characteristics of two groups are designated by combinations of group symbols.

MAJOR DIVISIONS			GROUP SYMBOLS		TYPICAL NAMES
COARSE GRAINED SOILS (More than 50% of material is LARGER than No. 200 sieve size)	GRAVELS (More than 50% of coarse fraction is LARGER than the No. 4 sieve size)	CLEAN GRAVELS (Little or no fines)		GW	Well graded gravels, gravel - sand mixtures, little or no fines.
				GP	Poorly graded gravels or grave - sand mixtures, little or no fines.
		GRAVELS WITH FINES (Appreciable amount of fines)		GM	Silty gravels, gravel - sand - silt mixtures.
				GC	Clayey gravels, gravel - sand - clay mixtures.
	SANDS (More than 50% of coarse fraction is SMALLER than the No. 4 Sieve Size)	CLEAN SANDS (Little or no fines)		SW	Well graded sands, gravelly sands, little or no fines.
				SP	Poorly graded sands or gravelly sands, little or no fines.
		SANDS WITH FINES (Appreciable amount of fines)		SM	Silty sands, sand - silt mixtures
				SC	Clayey sands, sand - clay mixtures.
FINE GRAINED SOILS (More than 50% of material is SMALLER than No. 200 sieve size)	SILTS AND CLAYS (Liquid limit LESS than 50)			ML	Inorganic silts and very fine sands, rock flour, silty of clayey fine sands or clayey silts and with slight plasticity.
				CL	Inorganic lays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays.
				OL	Organic silts and organic silty clays of low plasticity.
	SILTS AND CLAYS (Liquid limit GREATER than 50)			MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts.
				CH	Inorganic clays of high plasticity, fat clays
				OH	Organic clays of medium to high plasticity, organic silts.
HIGHLY ORGANIC SOILS				PT	Peat and other highly organic soils.

R - VALUE DATA SHEET

P.N. 4953-15-0432
LAUSD Polytechnic

PROJECT NUMBER 40400 BORING NUMBER: B-6 @ 0'-3'

SAMPLE DESCRIPTION: Brown Silty Sand

Item	SPECIMEN		
	a	b	c
Mold Number	7	5	9
Water added, grams	48	31	38
Initial Test Water, %	10.0	8.3	9.0
Compact Gage Pressure,psi	50	140	100
Exudation Pressure, psi	134	646	325
Height Sample, Inches	2.52	2.50	2.51
Gross Weight Mold, grams	3092	3086	2906
Tare Weight Mold, grams	1968	1975	1789
Sample Wet Weight, grams	1124	1111	1117
Expansion, Inches x 10exp-4	1	6	5
Stability 2,000 lbs (160psi)	16 / 30	13 / 22	14 / 24
Turns Displacement	5.28	4.51	4.98
R-Value Uncorrected	67	78	74
R-Value Corrected	67	78	74
Dry Density, pcf	122.9	124.3	123.7
	DESIGN CALCULATION DATA		
Traffic Index Assumed:	4.0	4.0	4.0
G.E. by Stability	0.34	0.23	0.27
G. E. by Expansion	0.03	0.20	0.17

Equilibrium R-Value	73 by EXUDATION	Examined & Checked: 7 /2/ 15
REMARKS:	Gf = 1.25 4.1% Retained on the 3/4" Sieve. Partial Free Drainage.	REGISTERED PROFESSIONAL ENGINEER STEVEN R. MARVIN C 30659 CIVIL STATE OF CALIFORNIA Steven R. Marvin, RCE 30659

The data above is based upon processing and testing samples as received from the field. Test procedures in accordance with latest revisions to Department of Transportation, State of California, Materials & Research Test Method No. 301.

Table 1 - Laboratory Tests on Soil Samples

AMEC Foster Wheeler
LAUSD - Polytechnic HS
Your #4953-15-0432, HDR Lab #15-0492LAB
1-Jul-15

Sample ID			B-1 @ 1'-4'	B-2 @ 1'-4'	B-6 @ 0-3'
Resistivity		**Units**			
as-received		ohm-cm	18,000	15,600	34,000
saturated		ohm-cm	2,600	3,440	8,400
pH			7.0	7.5	7.6
Electrical Conductivity		mS/cm	0.19	0.11	0.07
Chemical Analyses					
Cations					
calcium	Ca^{2+}	mg/kg	112	56	52
magnesium	Mg^{2+}	mg/kg	20	6.8	4.0
sodium	Na^{1+}	mg/kg	26	50	28
potassium	K^{1+}	mg/kg	17	11	10
Anions					
carbonate	CO_3^{2-}	mg/kg	ND	ND	ND
bicarbonate	HCO_3^{1-}	mg/kg	58	113	149
fluoride	F^{1-}	mg/kg	2.0	5.3	2.8
chloride	Cl^{1-}	mg/kg	9.8	13	12
sulfate	SO_4^{2-}	mg/kg	324	78	23
phosphate	PO_4^{3-}	mg/kg	ND	ND	ND
Other Tests					
ammonium	NH_4^{1+}	mg/kg	ND	ND	ND
nitrate	NO_3^{1-}	mg/kg	49	59	12
sulfide	S^{2-}	qual	na	na	na
Redox		mV	na	na	na

Electrical conductivity in millisiemens/cm and chemical analysis were made on a 1:5 soil-to-water extract.
mg/kg = milligrams per kilogram (parts per million) of dry soil.
Redox = oxidation-reduction potential in millivolts
ND = not detected
na = not analyzed

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in 40 CFR Part 312. I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Skye Green - Principal Engineer

2.0 EXECUTIVE SUMMARY

2.1 Subject Property Description

CES GROUP performed a Phase I Environmental Site Assessment, that included on-site observations of the accessible areas of 12431 Roscoe Blvd (the "Property") in Sun Valley, CA 91352, on July 21, 2016. The Property is located at the northeast intersection of Arleta Avenue and Roscoe Boulevard. Site maps are included in Appendix A.

The Property is approximately 47 acres and is improved with a high school including a main office building, a school library, an auditorium, two gymnasiums, a cafetorium, maintenance building, athletic fields, and classroom buildings. The property is a mixture of paved and unpaved areas, small planters, and athletic field space. The property is located within a largely residential and commercial area and is zoned Z1 for Public Facilities.

According to the City of Los Angeles Department of Building and Safety, the first construction at the Property was completed in 1956 with subsequent additions and renovations. This information is confirmed by historic aerial photographs of the Site. There is currently Byrd Middle School to the west, Sheldon Arleta Park and former landfill to the northwest, and residential areas to the northeast, east and south.

This assessment took place in July, 2016 with a site visit occurring on July 21, 2016. No data failures/data gaps were encountered during this Phase I ESA.

The following summarizes the independent conclusions representing CES GROUP's best professional judgment based on information and data available to us during the course of this assignment. Factual information regarding operations, conditions, and test data provided by the Client, owner, or their representative has been assumed to be correct and complete. Additionally, the conclusions presented are based on the conditions that existed at the time of the assessment.

2.2 Data Gaps

CES Group has been able to research the use of the Subject Property back to its first developed use. No Data Gaps have been encountered for this property.

2.3 Environmental Report Summary

The purpose of the Phase I is to identify existing or potential recognized environmental conditions (as defined by ASTM Standard E1527-13). A recognized environmental condition (REC) refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment. The following RECs were identified during this assessment:

- The adjacent former landfill
- Arsenic. It was formerly common practice for the LAUSD to apply an arsenic-based herbicide to soil prior to paving. Due to this practice, it is possible that elevated arsenic concentrations could be present in the soils directly beneath the paved portions of the Site.

A controlled recognized environmental condition refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. No controlled recofnized environmental conditions were identified during this assessment.

A historical recognized environmental condition refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. No historical recognized environmental conditions were identified during this assessment.

An environmental issue refers to environmental concerns identified by CES Group, which do not qualify as RECs; however, warrant further discussion. The following environmental issues were identified during this assessment:

- Lead-based paint. Due to its slow deterioration with time, the paint can accumulate in soils that adjoin buildings and result in elevated lead concentrations. The buildings at this Site are adjoined by pavement but there are open planter areas between the buildings that contain trees.

2.3 Environmental Report Summary (continued)

- Fuel Bunker. Drums of gasoline, diesel, and contaminated gasoline were observed in a flammable materials storage room at the Site. Indications of releases from these fuel containers were not evident at the time of the assessment.
- Clarifiers. A clarifier was observed adjacent to the chemistry room and another clarifier was observed in the ceramics class.

Report Section		No Further Action	REC	HREC	CREC	Issue/Further Investigation	Comments
4.4	**Current Use of Property**	X					
4.6	**Adjoining Property Information**	X	X				The former Sheldon-Arleta Landfill is located north of the site and has a methane mitigation program.

7.3.12	**Wells**	X					
	Asbestos-Containing Materials	X					
	Lead-Based Paint	X				X	Lead-based paint and arsenic may be present on site. Soil sampling is recommended for further evaluation.
	Radon	X					
	Wetlands	X					
	Microbial Contamination (Mold)	X					

2.4 Recommendations

Based upon our understanding of the proposed project, there is a proposed modernization project at Franics Polytechnic High School that consists of the possible seismic evaluation and retrofit of up to six buildings, the demolition/removal of

2.4 Recommendations (continued)

several buildings, the construction of a new classroom building, and the potential construction of a service delivery road and yard.

Based on the conclusions of this assessment, CES Group recommends the following:

- Consideration must be given to the management of the methane gas system during demolition and construction.
- Should construction activities involve the disturbance of ACM and/or suspect ACM and lead-based paint, proper management techniques should be employed for the handling of soil and demolition materials in accordance with all applicable environmental agency rules and requirements.
- Sampling the soils in the planter areas and between buildings that are planned for demolition or earthwork.
- Sampling the soil in the areas of the clarifiers.
- Sampling in the hazardous materials storage area to confirm that there has been no release.

3.0 INTRODUCTION

3.1 Purpose

CES GROUP conducted an on-site Environmental Site Assessment of the Property that consisted of a walk-through observation of the accessible areas and interviews with facility personnel and local agency representatives. On-site activities and/or interviews were conducted by Daniel Baysa, with:

- Eric Longenecker, OEHS
- Ray Parreras, Plant Manager

An Environmental Questionnaire was partially completed through interview but was not completed due to lack of specific knowledge. Interviews were conducted during the site walk with regards to knowledge of site specifics and site history. Eric Longenecker provided CES Group with historic maps and information regarding previous environmental issues and future site plans.

Most areas of the property were available for observation during the site visit although each individual classroom was not observed and instead representative classrooms were observed. Areas accessed included classroom buildings, storage areas, chemistry classroom and storage room, ceramic classroom and storage area, former auto shop area, cafetorium, and common areas.

The weather at the time of the site visit was approximately 75 degrees Fahrenheit, with blue skies and some clouds, and a slight breeze.

CES GROUP reviewed available federal, state, and local records in an effort to identify sites of known or suspected hazardous waste activity located at or near the Property, which could have an adverse impact on the Property. In an attempt to determine whether historical uses of the Property and surrounding areas have had an environmental impact on the Property, CES GROUP interviewed individuals knowledgeable about the Property and reviewed available pertinent records and documents. This assessment is based on the evaluation of the information gathered, and accessibility at the time of the assessment.

The purpose of this report is to provide the Client an assessment concerning environmental conditions (limited to those issues identified in the report) as they existed at the Property. The assessment was conducted utilizing generally accepted Phase I industry standards using the American Society for Testing and Materials (ASTM) Standard Practice E 1527-13. The scope of work included an evaluation of:

- The Property history in an attempt to identify any possible ownership(s) and/or uses that would suggest an impact to the environmental integrity of the Property as identified through review of reasonably ascertainable standard historical sources.

- Physical characteristics of the Property as identified through review of reasonably ascertainable topographic, wetlands, flood plain, soils, geology, and groundwater data.

- Current Property conditions (as applicable), including compliance with appropriate regulations as they pertain to the presence or absence of:

    - Facility storage tanks, drums, containers (above or below ground), etc.
    - Transformers and other electrical equipment which utilize fluid which may potentially contain PCBs
    - The use of hazardous materials/chemicals and petroleum products, and/or the generation, treatment, storage, or disposal of hazardous, regulated, or medical wastes

This report provides a screening approach for the potential existence of:

- Asbestos, including the identification of all suspect materials in accessible areas (interior and exterior).

- This screening approach is not a comprehensive (i.e., AHERA-Style) asbestos survey, nor is it intended to fill the NESHAP requirements for demolition/renovation purposes, but is intended to identify the potential for an asbestos hazard in accessible areas. This screening is not intended to be used for demolition, abatement, renovation, or repair work.
  The basis for "suspect" determination is taken from the materials listed in Appendix G of the United States Environmental Protection Agency (USEPA) publication Managing Asbestos in Place (the "Green Book"). Therefore, all materials listed in the Green Book, which were installed prior to 1981 are considered suspect with the exception of resilient floor tile, asbestos-cement board (transite), and roofing felt, which are considered

3.1 Purpose (continued)

suspect regardless of installation date (these materials continue to be manufactured and installed in the United States).

- Radon gas propensity, through the review of the USEPA's Map of Radon Zones.

- Lead-based paint for properties constructed prior to 1978. The basis for this determination is taken from the Lead Paint Poisoning Act passed by the Congress of the United States that banned the use of lead paint starting January 1, 1978. Therefore, all paint applied prior to 1978 is considered suspect.

- Lead in water was investigated by inquiring of the water supplier, California Water Service Company, whether the drinking water satisfied Federal, state and local regulations.

An evaluation of information contained in programs such as the NPL, CERCLIS, SHWS, RCRIS, SWF, LUST, and other governmental information systems within specific search distances of the Property. This evaluation was performed to identify any sites that would have the potential to impact the environmental integrity of the Property.

The regulatory agency report provided is based on an evaluation of the data collected and compiled by a contracted data research company. The report is based on a radius search, which focuses on both the Property and neighboring sites that may impact the Property. Neighboring sites listed in governmental environmental records are identified within a specific search distance. The search distance varies depending upon the particular government record being checked. The search is designed to meet the requirements of ASTM Standard E 1527-13. The information provided is assumed to be correct and complete.

Visual observation of the adjacent properties to identify high-risk neighbors and the potential for known or suspected contamination to migrate onto the Property.

3.2 Scope of Work

The Phase I ESA conducted at the Subject Property was in general accordance with ASTM Standard E 1527-13 and included the following:

- Review of previous environmental site assessments;
- Records review;
- Interviews with regulatory officials and personnel associated with the subject and adjoining properties;
- A site visit; and
- Evaluation of information and preparation of the report provided herein.

Typically, a Phase I ESA does not include sampling or testing of air, soil, groundwater, surface water, or building materials. These activities would be carried out in a Phase II ESA, if required. For this Phase I ESA, no additions to the ASTM E 1527-13 standard were made.

3.3 Significant Assumptions

CES Group has prepared this Phase I Environmental Site Assessment using reasonable efforts in each phase of its work to identify recognized environmental conditions associated with hazardous substances or petroleum products at the property. The scope-of-work for this Phase I ESA was consistent with the ASTM Practice E 1527-13. Findings within this report are based on information collected from observations made on the day of the site investigation and from reasonably ascertainable information obtained from governing public agencies and referenced sources.

This report is not definitive and should not be assumed to be a complete or specific definition of all conditions above or below grade. Subsurface conditions may differ from the conditions implied by the surface observations and can only be reliably evaluated through intrusive techniques. Information in this report is not intended to be used as a construction document and should not be used for demolition, renovation, or other construction purposes. CES Group makes no representation or warranty that the past or current operations at the property are or have been in compliance with all applicable federal, state and local laws, regulations and codes.

Regardless of the findings stated in this report, CES Group is not responsible for consequences or conditions arising from facts that were concealed, withheld, or not fully disclosed at the time the assessment was conducted.

3.3 Significant Assumptions (continued)

This report does not warrant against future operations or conditions, nor does it warrant against operations or conditions present of a type or at a location not investigated.

The regulatory database report provided is based on an evaluation of the data collected and compiled by a contracted data research company. The report focuses on the property and neighboring properties that could impact the property. Neighboring properties listed in governmental environmental records are identified within specific search distances. The search distance varies depending upon the particular government record being checked. The regulatory research is designed to meet the requirements of ASTM Practice E 1527-13. The information provided in the regulatory database report is assumed to be correct and complete unless obviously contradicted by field observation or other reviewed sources.

Reasonable efforts have been made during this assessment of aboveground and underground storage tanks and ancillary equipment. "Reasonable efforts" are limited to information gained from visual observation of largely unobstructed areas, recorded database information held in public record and available information gathered from interviews. Such methods may not identify subsurface equipment that may have been hidden from view due to snow cover, paving, construction or debris pile storage, or incorrect information from sources.

CES Group is not a professional title insurance firm and makes no guarantee, explicit or implied, that any land title records reviewed represent a comprehensive or precise delineation of past site ownership or occupancy for legal purposes.

3.4 Limitations and Exceptions

Along with all of the limitations set forth in various sections of the ASTM E 1527-13 protocol, the accuracy and completeness of this report may be limited by the following:

- Access Limitations
- Physical Obstructions to Observations
- Outstanding Information Requests
- Historical Data Source Failure

It should be noted that this assessment did not include a review or audit of operational environmental compliance issues, or of any environmental management systems (EMS) that may exist on the property. Where required, the documents listed in Appendices A and E were used as reference material for the completion of the Phase I ESA. Some of the information presented in this report was provided through existing documents and interviews. Although attempts were made, whenever possible, to obtain a minimum of two confirmatory sources of information, CES Group in certain instances has been required to assume that the information provided is accurate.

The information and conclusions contained in this report are based upon work undertaken by trained professional and technical staff in accordance with generally accepted engineering and scientific practices current at the time the work was performed. The conclusions and recommendations presented represent the best judgment of CES Group based on the data obtained from the work. Due to the nature of investigation and the limited data available, CES Group cannot warrant against undiscovered environmental liabilities. Conclusions and recommendations presented in this report should not be construed as legal advice.

Should additional information become available which differs significantly from our understanding of conditions presented in this report, we request that this information be brought to our attention so that we may reassess the conclusions provided herein.

3.5 Deviations

No deviations from the recommended scope of ASTM Standard E 1527-13 were performed as part of this Phase I ESA with the exception of any additions noted in Detailed Scope of Services.

3.6 Special Terms and Conditions

Authorization to perform this assessment was given by the client on June 27, 2016. Instructions as to the location of the property, access, and an explanation of the property and facilities to be assessed were provided by Los Angeles Unified School District (LAUSD) Office of Environmental Health and Safety (OEHS).

3.7 Reliance

Civil-Environmental-Survey Group (CES GROUP) has completed a Phase I Environmental Site Assessment of 12431 Roscoe Blvd (the "Property") in Sun Valley, CA 91352. The assessment was performed at the Client's request using the methods and procedures consistent with good commercial and customary practice designed to conform to acceptable industry standards.

Any third party agrees by accepting this report that any use or reliance on this report shall be limited by the exceptions and limitations in this report, and with the acknowledgment that actual site conditions may change with time, and that hidden conditions may exist at the Property that were not discoverable within the authorized scope of the assessment.

CES Group makes no other representation to any third party except that it has used the degree of care and skill ordinarily exercised by environmental consultants in the preparation of the report and in the assembling of data and information related thereto. No other warranties are made to any third party, either express or implied. CES Group's liability to any third party authorized to use or rely on this report with respect to any acts or omissions shall be limited to a maximum of $5000.

The results of the assessment provided herein are in no way intended to represent a guarantee that the subject property is free from past, present or future hazardous substance and waste contamination, but only that a reasonable inquiry has been conducted to ascertain the likelihood of such potential contamination, under current applicable law. Furthermore, the accuracy of the results of the regulatory agency database searches are constrained and limited by the level of care and professional skill exercised by the sub-consultants retained by CES GROUP to perform these tasks.

If you have any questions regarding this report, please contact the CES Group at (714) 398-6363.

4.0 SITE DESCRIPTION

4.1 Location and Description

The Property is located at 12431 Roscoe Blvd, Los Angeles County, in Sun Valley, CA, 91352. Sun Valley is a neighborhood in the San Fernando Valley region of the City of Los Angeles, California.

The Property lands (APN# 2634-019-900) are located on the northeast intersection of Arleta Avenue and Roscoe Boulevard. The Property is approximately 47 acres and is improved with a high school including a main office building, a school library, an auditorium, two gymnasiums, a cafetorium, maintenance building, athletic fields, and classroom buildings. The property is a mixture of paved and unpaved areas, small planters, and athletic field space. The property is located within a largely residential and commercial area and is zoned Z1 for Public Facilities.

4.2 Activity/Use Limitations

CES Group has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-13 of the property located at 12431 Roscoe Blvd, Sun Valley, CA 91352. Any exceptions to or deletions from this practice are described in Section 3.5 of this report. LAUSD provided no information regarding property activitity or use limitations.

4.3 Site and Vicinity Description

The Subject Property consists of approximately 47 acres and is developed with multiple structures that comprise the high school. The ground surface at the site slopes towards the south. Groundcover consists primarily of concrete/asphalt, open grass areas, and planters. The subject property can be accessed from Arleta Avenue's main entrance.

The site is zoned Z1 for Public Facilities. There is currently Byrd Middle School located to the west of the property, Sheldon Arleta Park and former landfill to the northwest, and residential areas to the northeast, east and south.

The Francis Polytechnic High School is an active high school. The school was opened in 1956 and has operated continuously since that date. The former Sheldon-Arleta Landfill is located to the north of the site. This landfill operated from 1962 until 1974 and was located in a former gravel pit used to mine construction materials prior to the conversion to a landfill. The former landfill had an active methane collection system in operation that was connected to a cogeneration plant which generated electrical power using the landfill methane gas. The former landfill had an extensive monitoring system in place that included vapor monitoring points along Wicks Street, which is the northwest border of the school site and an active positive pressure methane suppression system connected to wells near the gymnasiums. As of 2012, the landfill gas collection system was placed underground to allow reclamation of the landfill for use as a recreational park. There is currently an extensive monitoring and mitigation system in place at the landfill and at Francis Polytechnic High School. The landfill gas collection system is permitted by SCAQMD and overseen by the Bureau of Sanitation. City staff continues to monitor and tune the well field on a regular basis. Construction activities at the landfill are ongoing.

The Property area is serviced by the Los Angeles Department of Water and Power. According to the 2015 Annual Water Quality Report, the water supplied to the Property area complies with federal, state, and local drinking water standards. There is an acceptable amount of lead in the water.

HVAC systems observed consisted of the following:

- Multiple HVAC systems for the various classrooms and buildings

4.4 Current Use of Property

The Property is approximately 47 acres and is improved with a high school campus. The campus includes a number of buildings with outdoor corridors and open areas. The high school property includes an auditorium, administration building, gymnasium, library, cafetorium, science classroom and storage area, ceramic classroom and storage area, maintenance and storage areas, athletic fields, and various classroom buildings.

4.5 Description of Structures and Other Improvements

Buildings on the property are of masonry or concrete construction. The building exterior is red brick masonry and stucco. The interior is constructed for its various uses and includes tile, wood floor, and stucco.

A current modernization project is planned for the school. This modernization will include the demolition of the following

4.5 Description of Structures and Other Improvements (continued)

- Administration Building
- Boys' Gymnasium
- Girls' Gymansium
- Cafeteria & Lunch Shelter
- Music Building
- Auditorium Building
- Library & Study Hall Building
- Math & Science Building
- Student Store & Concessions Buildings
- Utility Building
- Sanitary Building
- Approximately 16 classrooms located in relocatable and modular buildings

Construction of the following facilites are planned:

- Approximately 41 classrooms and support spaces
- Gymnasium
- Auditorium & Performing Arts Building
- Food Services Building & Lunch Shelter
- Maintenance & Operations Building
- Administration & Library Buildings
- Sanitary Building

In addition, site upgrades will take place including utility upgrades, landscape, hardscape, exterior paint, and roof repair.

The LADWP supplies drinking water and electricity to the Subject Property from the municipal distribution system. Sanitary discharges on the subject site are discharged into the municipal sanitary sewer system. The subject site area is serviced by the City of Los Angeles and Los Angeles County.

4.6 Adjoining Property Information

During the vicinity reconnaissance, CES Group observed the following land use on properties in the immediate vicinity of the Property,

The general area is composed of residential and commercial structures. The following adjacent properties were observed:

North - The Property is bordered on the north by Sheldon Arleta Park and a former landfill to the northwest past Wicks Street and residences to the northeast past Sharp Avenue.

East - The Property is bordered on the east by residences and Peoria Street.

South - The Property is bordered on the south by Roscoe Blvd and residences. There is a Mobil Gas Station located across Roscoe Blvd.

West - The Property is bordered to the west by Arleta Avenue and Byrd Middle School. There is also a Department of Water and Power building and a CIF offices.

The Mobil Gas Station across the street has a closed LUST case. Based on the gas station's downgradient location, it is unlikely to impact the site. No further action is recommended regarding the adjacent gas station. The former Sheldon-Arleta Landfill is a recognized environmental concern and has an operating gas mitigation system.

5.0 USER PROVIDED INFORMATION

5.1 Specialized Knowledge

CES Group has no specialized knowledge of the Subject Property outside of the research which was conducted and reported as part of this report.

The property ownership and tenants as well as all individuals who were interviewed as part of this investigation, have not reported any specialized knowledge of this Subject Property outside of what is contained in this report.

5.2 Owner, Property Manager, and Occupant Information

According to the property title, the property owner is the Los Angeles Unified School District (LAUSD).

A representative of LAUSD, Mr. Eric Longenecker, indicated that it was formerly common practice for the LAUSD to apply an arsenic-based herbicide to soil prior to paving. Due to this practice, it is possible that elevated arsenic concentrations could be present in the soils directly beneath the paved portions of the Site. It is not known if this practice was used at this Site during its initial development.

5.3 Reason For Performing Phase I ESA

The purpose of this Phase I Environmental Site Assessment (ESA) was to identify existing or potential Recognized Environmental Conditions (as defined by ASTM Standard E 1527-13) in connection with the Subject Property. CES Group understands that the findings of this study will be used for site assessment information during planned site renovations and construction improvements.

6.0 RECORDS REVIEW

6.1 Standard Environmental Records Sources

CES Group contracted Environmental Data Resources, Inc. (EDR) to conduct a search of Federal and State databases containing known and suspected sites of environmental contamination. The number of listed sites identified within the approximate minimum search distance (AMSD) from the Federal and State environmental records database listings specified in ASTM Standard E 1527-13 are summarized in the following table. Detailed information for sites identified within the AMSDs is provided below, along with an opinion about the significance of the listing to the analysis of recognized environmental conditions in connection with the subject property. Copies of the EDR research data and a description of the databases are included in Appendix D of this report.

Based on review of the regulatory database report, CES GROUP concludes that the Property is listed on the 7 databases listed below:

- RCRA-LQG: Resource Conservation and Recovery Act (RCRA) Large Quantity Generator is a site that is identified as generating over 1,000 kg of hazardous waste or over 1kg of acutely hazardous waste per month.
- RCRA-SQG: RCRA Small Quantity Generator is a site that is identified as generating between 100 kg and 1,000 kg of hazardous waste per month.
- FINDS: The property is listed on the EPA's Facility Index System, indicating that it is a facility regulated by the EPA
- ECHO: The property is listed on the EPA's Enforcement and Compliance History Online, indicating that there is compliance information relating to the Site.
- SCH: The property is listed as an existing school site being evaluated by DTSC for possible hazardous materials contamination
- ENVIROSTOR: The Site is listed in the DTSC's Envirostor program as a closed school investigation site
- HAZNET: The City of Los Angeles is identified along with the site due to hazardous materials

CES GROUP also reviewed the unmappable sites in the database report, cross-referencing addresses and site names. Unmappable sites are environmental risk sites that cannot be plotted with confidence, but can be located by zip code or city name. In general, a site cannot be geocoded because of inaccurate or missing location information in the record provided by the agency. Any identified unmappable site within the specified search radii is included below.

The following is a summary of the findings of the database review:

Map Findings Summary

Database	Target Property	Search Distance (Miles)	< 1/8	1/8 - 1/4	1/4 - 1/2	1/2 - 1	> 1	Total Plotted

Detail Summary

Site Name:	CITY OF LOS ANGELES - DPW - BUREAU SANIT
Databases:	HAZNET
Address:	12431 ROSCO BLVD
Distance:	0
Direction:	Southwest
Elevation:	Higher
Comments:	The Bureau of Sanitation oversees the Methane monitoring program. It is listed as a hazardous materials site.

Site Name:	LAUSD--FRANCIS POLYTECHNIC HS
Databases:	FINDS, ECHO, RCRA-SQG, RCRA-LQG, ENVIROSTOR, SCH, HAZNET
Address:	12431 ROSCOE BLVD.
Distance:	0
Direction:	Southwest
Elevation:	Higher
Comments:	Listing on these databases indicates that the Site is a regulated facility. The Site is listed as a small and large quantity generator of hazardous waste. DTSC provides oversight of the environmental assessments and Envirostor is where their documents are maintained. Haznet indicates that hazardous materials are present.

Site Name:	CITY OF LOS ANGELES-DPW
Databases:	HAZNET
Address:	12431 ROSCOE BLVD
Distance:	0
Direction:	Southwest
Elevation:	Higher
Comments:	Previously contained a LUST. The site is listed as a closed case.

Site Name:	LAUSD-NORTH HOLLYWOOD POLY CAS
Databases:	HAZNET
Address:	12431 ROSCOE BLVD
Distance:	0
Direction:	Southwest
Elevation:	Higher
Comments:	This listing shares the same address as the Site.

Site Name:	LEWIS CONTINUATION HIGH SCHOOL
Databases:	RCRA-LQG
Address:	12508 WICKS ST
Distance:	18
Direction:	NNW
Elevation:	Higher
Comments:	Large quantity generator of over 1000 kg of hazardous waste per month.

6.1 Standard Environmental Records Sources (continued)

Site Name:	EAST VALLEY AREA NEW HIGH SCHOOL NO. 1A
Databases:	ENVIROSTOR, SCH
Address:	8451 ARLETA AVENUE
Distance:	58
Direction:	Northwest
Elevation:	Higher
Comments:	This site is listed as having DTSC oversight.

Site Name:	
Databases:	EDR Hist Auto
Address:	12440 ROSCOE BLVD
Distance:	70
Direction:	Southwest
Elevation:	Lower
Comments:	A historical automobile shop is located in a presumed downgradient location and at a lower elevation. No impacts are anticipated to the Site.

Site Name:	MOBIL STATION HNG
Databases:	HIST CORTESE, LUST, UST
Address:	12450 ROSCOE BLVD
Distance:	71
Direction:	Southwest
Elevation:	Lower
Comments:	This site is listed as a closed site. Due to its location and elevation, no site impacts are anticipated.

Site Name:	AVANTI 33 (STATE)
Databases:	HIST UST
Address:	12450 ROSCOE BLVD
Distance:	71
Direction:	Southwest
Elevation:	Lower
Comments:	This site is listed as a closed site. Due to its location and elevation, no site impacts are anticipated.

Site Name:	JED GAS STATION
Databases:	CA FID UST, SWEEPS, LUST
Address:	12450 ROSCOE BLVD
Distance:	71
Direction:	Southwest
Elevation:	Lower
Comments:	This site is listed as a closed site. Due to its location and elevation, no site impacts are anticipated.

Site Name:

Elevation:	Lower
Comments:	Former landfill site that has a methane mitigation program and is currently under oversight.

Site Name:	HIRO PHOTO LAB
Databases:	ECHO, FINDS, RCRA-SQG
Address:	8365 LAUREL AVE
Distance:	826
Direction:	ENE
Elevation:	Higher
Comments:	No negative environmental impacts are anticipated based on the proximity to the Site.

6.2 Additional Environmental Record Sources

CES Group conducted a file review for information maintained by the Los Angeles County Department of Public Health using a Public Health Information Request (PHICOR) on June 30, 2016. According to the Consolidated Contingency Plan on file (dated 2012), the site contains hazardous materials and generates hazardous waste. Information is provided to CUPA. There was no record of any USTs or ASTs. The site is reported to contain gasoline drums, diesel drums, compressed gas cylinders, and chemistry products. The site is a small quantity generator of hazardous waste due to maintenance items (5) and science class items (4). There is no auto class and no photo class documented. Waste streams consist of paint, oil, lights, and gym finish. According to a 2007 DTSC Waste Manifest Report, there was unspecified aqueous solutions, asbestos containing waste, and inorganic solid waste removed from the site.

The following items are/were reported on site in the 2012 Contingency Plan:
Fuel Bunker/ Hazardous Storage Room:

- Gasoline drums (55-gallon steel drums)
- Contaminated gasoline (55-gallon steel drum)
- Diesel drums (55-gallon)

Round House/ Plant Managers Storage Area:

- Waste paint (water based) 55 gal
- Gym finish (5 gal plastic/non-metallic drum)
- Flourescent Lamps, bulbs, metal halide lamps waste (0.5 cu yd box) - maintenance
- Lead paint debris (solid waste) 55 gal metal drum - maintenance
- Paint thinner, petroleum distillates (55 gal drum) - maintenance
- Waste aerosols (5 gal fiber drum) solid waste - maintenance

Science Storage Area:

- Waste oxidizing liquid (ammonium nitrate, lead nitrate) - 5 gal plastic/non-metallic
- Waste nitric acid - 5 gal plastic/non-metallic
- Waste corrosive liquid basic inorganic (sodium hydroxide)- 16 gal plastic/non-metallic
- Waste corrosive liquid acid (HCl, sulfuric acid) - 16 gal plastic/non-metallic
- Waste oil/used oil - 30-gal drum plastic/non-metallic

CES Group contacted LA County Fire Department Health and Hazardous Materials Division and LA City Fire Department. All records were reported to be stored with PHICOR. A copy of returned request form from the Los Angeles Fire Department indicating no records were found is included in Appendix E.

CES Group contacted the County of Los Angeles Department of Public Works Environmental Programs Division. There were no records pertaining to the Site.

CES Group sent a records request to the City of LA Department of Building and Safety. They conducted a file review and said that the only records they have are original building permits from the 1950s. There were no environmental issues on record. A copy of the request form is included in Appendix E.

CES Group conducted a search of the Department of Toxic Substances Control (DTSC) files on Envirostor and found that there was previously a school investigation for Francis Polytechnic High School (File 19820072) that led to No further Action. The school was constructed in 1956. The site is adjacent to the former Sheldon Arleta Landfill, which operated from 1962 to 1974. Despite a PEA - NFA determination issued in 12/19/00, the District elected to conduct an SSI to further evaluate soil gas impacts from the former Sheldon-Arleta Landfill which operated from 1962 to 1974 and was located adjacent to the proposed High School expansion site. DTSC issued a NFA determination on the SSI on 3/25/04. Potential contaminants of concern were lead and VOCs in soil and soil vapor.

CES Group conducted a search of Regional Water Quality Control Board (RWQCB) files on Geotracker and found that there were no sites found on the property. A Mobil gas station located across the street at Roscoe and Whitsett Avenue had a leak reported in 1999. There was previously a LUST Cleanup Site at 12450 Roscoe Blvd with the case closed on 4/11/2001. The contaminant of concern was gasoline. Another LUST is located at Wicks and Arleta at the site labeled as the "City of LADWP" (8501 Arleta Ave., Sun Valley). The Los Angeles Deparment of Public Works is located at this address. The case was closed on 4/11/2001. This site involved diesel contamination in soil that leaked in 1999.

Geotracker also reports the Sheldon Arleta Landfill land disposal site. According to Geotracker, the site is open but closed with monitoring as of 5/30/16. Several groundwater wells are located within the former landfill area for environmental sampling (see Section 6.3.3). A landfill gas collection system is operational and permitted by SCAQMD. Routine inspection and maintenance of the monitoring system occurs.

According to SCAQMD's Facility Information Detail (FIND) database, Polytechnic High School is listed as an active site with no violations and no notices to comply. A request from SCAQMD indicated that there were no active permits on file.

6.2 Additional Environmental Record Sources (continued)

Previous permits for solvent use were on file but inactive. SCAQMD indicated that they had no permits for the landfill. Backup documentation from these file searches is included in Appendix E.

6.3 General Site Setting

The elevation of the subject property is approximately 823 feet above mean sea level, as depicted on the accompanying U.S.G.S. 7.5 Minute Series Topographic Map of the Van Nuys quadrangle, photo revised 2012. A copy of the USGS map is located in Appendix C.

6.3.1 Topography

Review of the Van Nuys, California Topographic Quadrangle, published by the United States Geological Survey (USGS) and dated 2012, indicated the following:

- The Property has an average elevation of approximately 823 feet above mean sea level (amsl) in the center of the site. Elevations do not vary significantly across the Property land. Slope in the general area of the Property is to the south at a gradient of 1 to 5%.
- There are no surface water bodies or wetlands located at the Property area.

A copy of the topographic map is located in Appendix C.

6.3.2 Surface Water Bodies

The nearest surface water in the vicinity of the Property is Tujunga Wash, located approximately 2000 feet to the west of the Property. No surface water is located on the Property. Spreading basins are located to the northwest of the property.

6.3.3 Geology and Hydrology

The site is located in the eastern portion of the San Fernando Valley. The San Fernando Valley is an elliptical-shaped alluvium-filled basin, approximately 23 miles wide and 12 miles long, formed by deposition from streams and rivers that have transported sediments from the surrounding upland areas. The alluvium is mainly derived from the Santa Monica Mountains to the south, the Santa Susana Mountains to the northwest, the Simi Hills to the west, the San Gabriel Mountains to the northeast, and the Verdugo Mountains to the east.

Regionally, the site is located in the Transverse Ranges geomorphic province. This province is characterized by east-west trending geologic structures that include the eastwest trending Santa Monica Mountains and the east-west trending active San Fernando fault zone. The trend of the San Fernando Valley reflects the overall trend of the Transverse Ranges, where major structural features exhibit an east-west orientation in contrast to the northwest-southeast trend that dominates in the rest of California. The San Fernando Valley is an area of compression between the San Gabriel Mountains on the northeast and the Santa Monica Mountains on the south. The east-west trend is reflected by the nearby San Fernando fault zone located approximately 4.4 miles to the northnortheast. The closest active fault is the Verdugo fault, located approximately 1.2 mile northeast of the site.

The site is located in the San Fernando Valley Groundwater Basin of the South Coast Hydrologic Region according to the California Department of Water Resources (DWR, 2003). According to the California Geological Survey, the historic-high groundwater level in the area is approximately 140 feet bgs (California Division of Mines and Geology, 1997). Water level measurements for Los Angeles County Well No. 4897 located 0.1 mile northwest of the site, indicate the most recent measured depth to groundwater was 328.8 feet bgs on December 3, 2009 (County of Los Angeles, 2015). This depth corresponds to a water surface elevation of 488.2 feet above mean sea level (MSL). The shallowest water recorded in this well was measured on August 3, 1993 with a depth of 186.9 and corresponding water surface elevation of 630.1 feet above MSL. This well has recorded groundwater from 1958 to 2009.

Geologic materials are reported to be fill to a depth of 4 feet underlain by Holocene- and Pleistocene-age alluvial deposits. The alluvial deposits in the upper 4 to 6 feet consist of silty sand. Below a depth of 4 to 6 feet, the deposits generally consist of sand with gravel and cobbles.

According to ZIMAS, the Site is located nearest the Verdugo Fault in the Transverse Ranges and Los Angeles Basin. Shallow soil types in the area are classified as fine sandy loam, gravelly loam, sand, and silty clay. Deeper soil types are

6.3.3 Geology and Hydrology (continued)

classified as stratified, clay loam, silty clay loam, gravelly sandy loam, coarse sand, sand, weathered bedrock, and very fine sandy loam.

Based on 2016 reports from the former landfill, hydraulic conductivity is estimated to be approximately 10 ft/day (silty sands). Depth to groundwater is approximately 360-470 feet bgs. No VOCs or SVOCs were detected in groundwater. Flow gradient from occurs from Landfill Well 8 toward SA-1A and SA-3A. Based on maps that were located, there are at least 2 wells that could be considered Well 8. There is a MW-8 and also a NEW-8. Flow from either of these wells towards SA-1A and SA-3A would be in the west or southwest direction. The exact flow direction can not be determined, however a southerly flow direction would be consistent with the topography of the area.

6.4 Historical Use

6.4.1 Historical Summary

Based upon interviews and a review of local agency records, the property uses have remained consistent. The site is currently an open school site for grades 9 through 12. The Subject Property currently houses the following chemicals:

- Gasoline and diesel fuels
- Maintenace chemicals including waste paint, gym finish, flourescent lamps, bulbs, and metal halide lamps, lead paint debris, paint thinner and petroleum distillates, waste aerosols
- Science chemicals for chemistry classes
- Ceramics materials

Previous site uses included a former auto shop. There was no evidence of any USTs, lifts, or ASTs on site.

6.4.2 Title Records

Review of available deed records did not identify any previous environmentally suspect ownership, easements, right of ways, or other environmental entries/restrictions associated with the Property. A search of environmental liens indicated that there are no environmental liens or use limitations located that are associated with the Property. LAUSD is listed as the Property owner.

6.4.3 City Directories

CES Group reviewed city directories for the subject and adjoining properties provided by EDR that covered the years 1920 through 2013. The Subject Property address was first listed in 1962 as Francis Polytechnic High School. In 1956, Heirshberg Construction Co. was listed at the address.

Adjoining properties were primarily composed of residential addresses with a few notable businesses including the following:
Byrd Junior High School, East Valley High School, Valley Region Middle School, 2013 (8501 Arleta Ave)
Department of Water & Power, 2001 (8501 Arleta Ave)
Cars 4 U, 2013, Auto Pros Inc., 2008 (12440 Roscoe Blvd)
Jeds Gas Station, 2013, State Oil No 33 (12450 Roscoe Blvd)
Pacific Rim Installations, 2008 (8200 Whit Sett Ave)
No Pouldarben Chevron, 2006 (8241 Whit Sett Ave)
Steve's Texaco Service, 1980, Cliff's Texaco, 1975 (12500 Roscoe Pl)
Wrought Iron Rail & Gates, 1980 (12351 Roscoe Blvd)
Quigley Machinery Moving, 1976 (12329 Burton St)
Barnes JAS L Union Oil Dealer, 1970 (12450 Rosco Pl)
ABCO Cleaning Service, 1970 (12534 Roscoe Pl)

6.4.4 Aerial Photos

Available aerial photographs were reviewed of the property and surrounding areas from EDR. Available photographs ranged from 1928 to 2012. The following are descriptions and interpretations from the aerial photograph review.

Copies of the aerial photographs are included in Appendix C.

Summary

Date(s)	Property Comments	Surrounding Area Comments
1928	The Site is vacant land with roads on three sides, a structure in the northeast quadrant, and possible agricultural use.	The surrounding area is vacant land with a few small structures.
1938	The Site is vacant land with roads on three sides, a structure in the northeast quadrant, and possible agricultural use. Subareas are more distinct.	The surrounding area is vacant land with a few small structures.
1947	The Site is vacant land with roads on three sides, a structure in the northeast quadrant, and possible agricultural use. The subareas are even smaller.	The surrounding area is vacant land with a few small structures. There are structures on the north side of Wicks Street.
1952	The Site is vacant land with roads on three sides, a structure in the northeast quadrant, and possible agricultural use. The subareas are less defined.	The surrounding area is vacant land with residential development beginning to show. There are structures on the north side of Wicks Street. Structures in "notch" along Sharp Avenue are present.
1964	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures. Only one structure on the north side of Wicks Street remains. Highway 5 is visible to the north.
1967	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures. The Sheldon-Arleta Landfill area shows signs of excavation/ gravel pit. Grading is evident for Hollywood Freeway (170).
1970	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures. The Sheldon-Arleta Landfill area shows signs of excavation/ gravel pit. Highway 170 is complete.
1977	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures. The Sheldon-Arleta Landfill area no longer shows signs of excavation.
1979	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures.
1983	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures. A commercial shopping center along Laurel Canyon to the east is evident.
1989	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures.
1994	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures. An office building to the west is present.
2002	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures.
2005	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures.
2009	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures. The office building is no longer present and Byrd MS to the west is present.

6.4.4 Aerial Photos (continued)

Date(s)	Property Comments	Surrounding Area Comments
2010	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures.
2012	The school structure is evident with athletic fields and multiple buildings.	The surrounding area is largely residential development and small structures. A single structure is now present on Sheldon-Arleta property.

6.4.5 Sanborn/Historical Maps

A search for fire insurance maps for the property and surrounding area was conducted by EDR. No such maps for the property were available.

6.4.6 Historical Topographic Maps

Available topographic maps dated 1894 through 2012 from EDR were reviewed for this Environmental Site Assessment. Copies of selected maps are included in Appendix C of this report. A summary of topographic maps is provided below.

Summary

Date(s)	Quad	Property Comments	Surrounding Area Comments
1894	Los Angeles	Subject property shows no development.	Surrounding area shows no development. Pacoima Wash, paths, some structures, and railroad tracks are visible.
1896	Santa Monica	Subject property shows no development.	Surrounding area shows no development. Pacoima Wash, paths, some structures, and railroad tracks are visible.
1898	Santa Monica	Subject property shows no development.	Surrounding area shows no development.Pacoima Wash, paths, some structures, and railroad tracks are visible.
1900	Los Angeles	Subject property shows no development.	Surrounding area shows no development. Pacoima Wash becomes Tujunga Wash, paths, some structures, and railroad tracks are visible.
1902	Santa Monica	Subject property shows no development.	Surrounding area shows no development. Pacoima Wash, paths, some structures, and railroad tracks are visible.
1921	Santa Monica	An on-site structure is shown at the corner of Wicks and Sharp.	More streets are added and a second railroad south of the site.
1927	Pacoima	Two on-site structures on the south side of Wicks Street are shown.	No changes from the previous map are noted.
1953	Van Nuys	The two previous structures along Wicks are gone, but one along Sharp and one along Arleta are present.	The Sheldon Arleta Landfill is labeled as a "Gravel Pit." There are structures on the north side of Wicks. Five structures are shown in the notch along Sharp.
1966	Van Nuys	The Subject Site is labeled "Francis Polytechnic High School." The Subject Site shows school buildings.	Surrounding areas show development. Sheldon-Arleta is still labeled as "Gravel Pit." Tujunga Spreading Grounds are labeled. Both Highways 5 and 170 are illustrated.
1972	Van Nuys	Subject property shows school buildings.	Surrounding areas show development.
2012	Van Nuys	Subject property is not shown due to lack of detail.	Surrounding areas show development.

6.4.7 Other Environmental Reports

LAUSD provided CES Group with environmental reports pertaining to the planned site development and the methane mitigation plan. The following reports were provided and reviewed:

Various site maps
Soil Export Certification Report, Converse Consultants, 2014
Landfill Gas Fact Sheet
A map model of probe locations
A presentation from an information meeting presented to school safety personnel (August 12, 2015)
ASB Informative document regarding site renovation (March 18, 2016)

According to the Soil Export Certification Report, the soil removed from the Site did not have any elevated metals concentrations. Total petroleum hydrocarbon, chlorinated herbicides, organophosphorous pesticides, volatile organic compounds, and semi-volatile organic compounds were not reported in the soil samples. Organochlorine pesticides were detected in two soil samples below regulatory limits.

6.4.8 Building Department Records

Records from LA Department of Building and Safety were reviewed for evidence indicating the developmental history of the Subject Property, and for the presence of documentation relative to underground storage tanks. The records review indicated that original building permits were on file. No environmental issues were identified. A copy of the EDR Building Permit search results is included in Appendix H.

6.5 Environmental Liens and Activity/Use Limitations

No environmental liens or activity/use restrictions in connection with the subject property were identified by the user/client.

6.6 Vapor Encroachment Evaluation

Vapor intrusion is a way by which chemicals in soil and groundwater can migrate into indoor air. Chemical vapors moving up through soil and into a building are a potential source of indoor air contamination and may pose a risk to human health. In evaluating the potential for a vapor encroachment condition on the subject site, CES Group attempted to determine if there was information indicating that chemicals of concern were located within the critical distance, defined as the lineal distance between the nearest edge of a contaminated plume and the nearest target property boundary. Based on ASTM E 2600-10 Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions, the critical distance is equal to 100 feet, with the exception of dissolved petroleum hydrocarbons, which have a critical distance of 30 feet. If non-aqueous phase petroleum hydrocarbons are present, the 100-foot critical distance is utilized.

CES Group has performed a Vapor Encroachment Screening in general accordance with the scope and limitations of ASTM Standard Practice E2600-10 for the subject site. CES Group utilized site and site vicinity specific criteria including groundwater gradient, distance of area properties of environmental concern from the subject site, and the types of constituents of concern which were released to evaluate potential vapor encroachment issues. The purpose of this Vapor Encroachment Screening is to identify the existing or potential vapor encroachment concern affecting the subject site.

The Vapor Encroachment Screen used the database search to identify possible properties that could have a potential for vapor intrusion. A list of the databases and distances from the property are listed in the table below. The full database results are included in Appendix F. The Vapor Encroachment Screen performed for the Subject Property indicates that several USTs, historical gas stations, and a former landfill have been located in the property area. Possible gas stations were located at the following addresses:

- Cars 4 U, 2013, Auto Pros Inc., 2008 (12440 Roscoe Blvd)
- Jeds Gas Station, 2013, State Oil No 33 (12450 Roscoe Blvd)
- No Pouldarben Chevron, 2006 (8241 Whit Sett Ave)
- Steve's Texaco Service, 1980, Cliff's Texaco, 1975 (12500 Roscoe Pl)
- Barnes JAS L Union Oil Dealer, 1970 (12450 Rosco Pl)

In addition, the Mobil Staton at 12450 Roscoe Blvd (southwest of the property) was listed as a LUST site with a leaking underground storage tank. JED Gas Station is also listed as having a LUST at the same site. This site is located at a

6.6 Vapor Encroachment Evaluation (continued)

lower elevation than the subject property. It is unlikely that soil vapors from this lower elevation will migrate upgradient to the Subject Property. According to Geotracker, this is a closed site.

The City of LADWP, located at 8501 Arleta Ave. (northwest of the site) is listed as having a LUST. The site is located at a higher elevation than the subject property. According to Geotracker, this site is closed.

Former Sheldon Arleta Landfill

The Former Sheldon-Arleta Landfill is a known contributor to methane gas in the subsurface in the area. There is currently a methane gas monitoring system to address these concerns. During the 1980s and 1990s, landfill gas infiltration was found to occur in the two gymnasium buildings. The City of Los Angeles Bureau of Sanitation has been overseeing the monitoring program since 1993.

According to the Fact Sheet provided by LAUSD, the gas monitoring equipment is located in the electrical room across from the school's main office and is connected to an autodialer and annunciator panel. The system is controlled by a programmable controller to continuously monitor 24 methane sensors located throughout the school campus. Through the autodialer device, key City and LAUSD personnel will be automatically notified whenever the methane sensors detect methane concentrations exceeding 15% of the lower explosive limit (LEL) of methane gas. A window box style annunciator panel located in the Administration office will also display which sensors are in alarm and detecting high methane concentrations. Gas production is reported to be between 200 and 400 cfm at 20% methane.

The gas extraction and monitoring configuration is as follows:
At the Landfill
- 30 Gas Extraction Wells (in refuse -- gas sent to flare)
- 34 Gas Migration Wells (in native soil at edge of landfill)
- 20 Multi-Depth Perimeter Probes (around outside perimeter)

At Francis Polytechnic HS
- 18 Multi-Depth Monitoring Probes monitored monthly, weekly, or daily (frequency based on conditions at landfill)
- 24 Monitoring Probes (monitored automatically)

The landfill represents a recognized environmental concern. There is currently an oversight program. Sampling of the existing wells or review of existing data is recommended to determine the extent of impact on site.

The following table outlines the properties that were identified as having a potential risk for vapor intrusion. Based on the distance from the site, the elevation of the sites, and location of these sites, none are believed to have a potential for vapor intrusion other than the Former Sheldon-Arleta Landfill. Four sites are listed within the 100-foot critical distance:
- Former Sheldon-Arleta Landfill
- City of LADWP - 8501 Arleta Ave. - listed as having a LUST. This property is located at a higher elevation than the property but any migration would move away from the high school property. According to Geotracker, this site is closed.
- East Valley Area New High School No. 1A (8451 Arleta Ave.). This property is located at a higher elevation than the property but any migration would move away from the high school property.
- Roscoe Site - 12500-12522 W. Roscoe Blvd - Listed as a Brownfields site and ECHO. This property is at an elevation that is lower than the Site.

7.0 SITE RECONNAISSANCE

7.1 Methodology and Limiting Conditions

The site reconnaissance was conducted on July 21, 2016 by Daniel Baysa of CES Group with Eric Longenecker of LAUSD OEHS and Ray Parreras, Plant Manager. Weather conditions at the time of the site reconnaissance were clear. The visual reconnaissance consisted of observing the boundaries of the property and systematically traversing the site to provide an overlapping field of view, wherever possible. The periphery of the on-site structure was observed along with interior accessible common areas, manufacturing, storage and maintenance areas. Photographs of pertinent site features identified during the site reconnaissance are included in Appendix B.

7.2 General Site Setting

The property consists of approximately 47 acres acres and is developed with a high school including a main office building, a school library, an auditorium, two gymnasiums, a cafetorium, maintenance building, athletic fields, and classroom buildings. The property is a mixture of paved and unpaved areas, small planters, and athletic field space. The property is located within a largely residential and commercial area and is zoned Z1 for Public Facilities. Groundcover consists primarily of the building, landscaped green areas, asphalt, and sparsely vegetated soil. The subject property is accessed from the main entrance on Arleta Avenue.

7.3 Site Visit Findings

7.3.1 Hazardous Substances

Visual observation for the use and/or storage of hazardous materials and petroleum products was performed. Visual observations indicated that hazardous substances are stored on the property as indicated in the Consolidated Contingency Plan located at the LA County Public Health Department.

The site Reconnaissance indicated that the site contains hazardous materials and generates hazardous waste. No evidence of USTs or ASTs was observed. Evidence of paint, oil, lights, and gym finish was observed along with science class materials and maintenance fuels and chemicals. Corrosive chemicals and acids were stored in a safe with a padlock and other chemicals were stored in a locked and labeled cabinet. Flammable liquids had a separate storage cabinet that was locked. A monthly safety check list was observed for handling of the science chemicals. An eye wash station and safety cleanup materials were also observed.

The following items are/were reported on site and confirmed during site reconnaissance:
Fuel Bunker/Hazardous Materials Storage :

- Gasoline drums (55-gallon steel drums)
- Contaminated gasoline (55-gallon steel drum)
- Diesel drums (55-gallon)

Round House/Plant Managers Storage Area:

- Waste paint (water based) 55 gal - maintenance
- Gym finish (5 gal plastic/non-metallic drum) - maintenance
- Flourescent Lamps, bulbs, metal halide lamps waste (0.5 cu yd box) - maintenance
- Lead paint debris (solid waste) 55 gal metal drum - maintenance
- Paint thinner, petroleum distillates (55 gal drum) - maintenance
- Waste aerosols (5 gal fiber drum) solid waste - maintenance

Science Storage Area:

- Waste oxidizing liquid (ammonium nitrate, lead nitrate) - 5 gal plastic/non-metallic
- Waste nitric acid - 5 gal plastic/non-metallic
- Waste corrosive liquid basic inorganic (sodium hydroxide)- 16 gal plastic/non-metallic
- Waste corrosive liquid acid (HCl, sulfuric acid) - 16 gal plastic/non-metallic
- Waste oil/used oil - 30-gal drum plastic/non-metallic

A clarifier was observed adjacent to the chemistry room and another clarifier was observed in the ceramics class.

A figure illustrating the locations of the above features on the campus is included in Appendix A "Site-Specific Details."

7.3.2 Petroleum Products

Petroleum products were identified on the subject property during the site reconnaissance. A gasoline drum (55-gallon), diesel drum (55-gallon), and contaminated gasoline drum (55-gallon) were located in the fuel bunker maintenance area. The petroleum products are used to fuel small vehicles and equipment necessary for school maintenance.

7.3.3 USTs

No evidence of underground storage tanks (USTs) or pipelines were identified at the subject property. No further action or investigation is recommended regarding storage tanks at the Property.

7.3.4 ASTs

No evidence of above-ground storage tanks (ASTs) or pipelines were identified at the subject property. No further action or investigation is recommended regarding storage tanks at the Property.

7.3.5 Other Suspect Containers

No other suspect containers were identified on the subject property during the site reconnaissance.

7.3.6 Equipment Likely to Contain PCBs

Fluorescent light fixture ballasts at the Property were observed during the site walk. Because the building was built before a 1979 ban regarding the manufacturing of PCB-containing light ballasts, it is possible that these ballasts contain PCBs. Care should be exercised during any demolition or removal of the ballasts. No further action is required regarding PCBs.

An electrical transformer is located on the property. No equipment with the potential to utilize dielectric fluid was observed during the site assessment.

7.3.7 Interior Staining/Corrosion

No interior staining or corrosion was observed in the subject building during the site reconnaissance.

7.3.8 Discharge Features

Discharge features (floor drains, catch basins, oil/water separators, etc.) were observed on the subject property during the site reconnaissance. A clarifier was observed adjacent to the science room and also in the ceramics building.

7.3.9 Pits, Ponds, And Lagoons

Observations during CES GROUP's assessment identified that the Property lands are graded to provide slope and swale to direct storm water away from the on-site buildings. The general topography of the area is directed towards the south. The Property has an average elevation of approximately 823 feet above mean sea level (amsl) in the center of the site.

Visual observation of the Property and adjacent properties did not identify any evidence of distressed vegetation, staining, or surface migration of petroleum releases or hazardous materials onto or off the Property. Visual observations did not identify any evidence of on-site surface impoundment facilities, pits, dry wells, or dumping of apparent hazardous substances at the Property.

Visual observations did not identify any surface water features including lagoons, ponds or other bodies of water at the Property.

Parking facilities consist of surface level asphalt pavement and concrete areas surrounding the school. Minor oil discharges were observed on the parking areas; however, the discharges are incidental in nature and corrective action is neither practical nor warranted.

Storm water from drive and parking surfaces is directed offsite by overland flow to the adjacent roads. Storm water from vegetated surface areas naturally infiltrates into the subsurface or is directed offsite via overland flow.

7.3.10 Solid Waste Dumping/Landfills

Visual observation for the generation, treatment, storage, and disposal of wastes was performed. There is evidence of waste drums but proper storage and removal protocol is in place. The dumpsters observed appeared to contain only solid material.

The site is located within a Methane Zone due to its proximity to the former Sheldon-Arleta Landfill. The former Sheldon-Arleta Landfill operated between 1955 and 1963. It was a Class III Landfill composed of residential waste, street sweepings, construction and demolition materials. There is a potential for methane and other volatile gases to occur beneath the site. Gas production is reported to be between 200 and 400 cfm at 20% methane. There is currently a methane mitigation system in place for existing buildings. For any new structures, a subsurface methane investigation would be required and if testing indicates that methane is present at the site, then an evaluation of a permanent methane gas control system may be necessary beneath proposed buildings at the site.

7.3.11 Stained Soil/Stressed Vegetation

No Stained Soil/Stressed Vegetation was observed on the subject property during the site reconnaissance.

7.3.12 Wells

Vapor probes were observed during the site reconnaissance. Vapor probes are reported to be monitored as part of the methane monitoring program at the Site.

8.0 INTERVIEWS

The following persons were interviewed to obtain information regarding *recognized environmental conditions* in connection with the property:

Eric Longenecker and Ray Parreras

Pertinent information from the interviews is discussed in applicable sections of this report. Qualifications of CES Group personnel are included in Appendix G.

9.0 OTHER ENVIRONMENTAL CONSIDERATIONS

The following environmental considerations were evaluated during site reconnaissance and Property research.

Asbestos-Containing Materials

Asbestos is the name for a group of naturally occurring silicate minerals that can be separated into fibers. The fibers are strong, durable, and resistant to heat and fire. They are also long, thin and flexible, so they can even be woven into cloth. Because of these qualities, asbestos has been used in thousands of consumer, industrial, maritime, automotive, scientific and building products. During the 20th century, some 30 million tons of asbestos have been used in industrial sites, homes, schools, shipyards and commercial buildings in the United States. Common ACMs include pipe-covering, insulating cement, insulating block, refactory and boiler insulation materials, transite board, fireproofing spray, joint compound, vinyl floor tile, ceiling tile, mastics, roofing products, and duct insulation for HVAC applications. Inhalation of asbestos fibers can result in deleterious health effects.

Considering the date of building construction (1956), it is possible that ACM may have been used at the Property. Environmental records indicate that ACM waste has been removed from the Site and is known to be present in the structure. During the site visit, all building materials appeared new and in good condition. Additional testing of the material may be necessary during planned renovation. Binders with records regarding ACM on site are maintained in the Administration Building.

Lead-Based Paint

Buildings constructed prior to 1978 are considered suspect for lead-based paint (LBP). Environmental records indicate that lead-based paint chips are among the items stored and removed from the site. During the site reconnaissance, visual observations of the painted areas were made. Paint at the Property appeared in good condition with no evidence of chipping or flaking. Further testing may be required in the event of demolition or construction. Binders with records regarding lead-based paint on site are maintained in the Administration Building.

Radon

Radon gas is a product of the decay series that begins with uranium. Radon is produced directly from radium, which can be commonly found in bedrock that contains black shale and/or granite. Radon gas can migrate through the ground and enter buildings through porous concrete or fractures. Radon tends to accumulate in poorly ventilated basements. Long-term exposure to radon has been associated with lung cancer.

Review of the USEPA's Radon Map for Los Angeles County, California indicated that the Property is located in Zone 2, areas with a predicted average indoor radon screening level between 2 and 4 pCi/L (picoCuries per liter of air). Radon sampling was not performed as part of this assessment.

Wetlands

The Subject Property does not appear to be designated wetland area. The area's slope would seem to preclude any designation as a wetlands area.

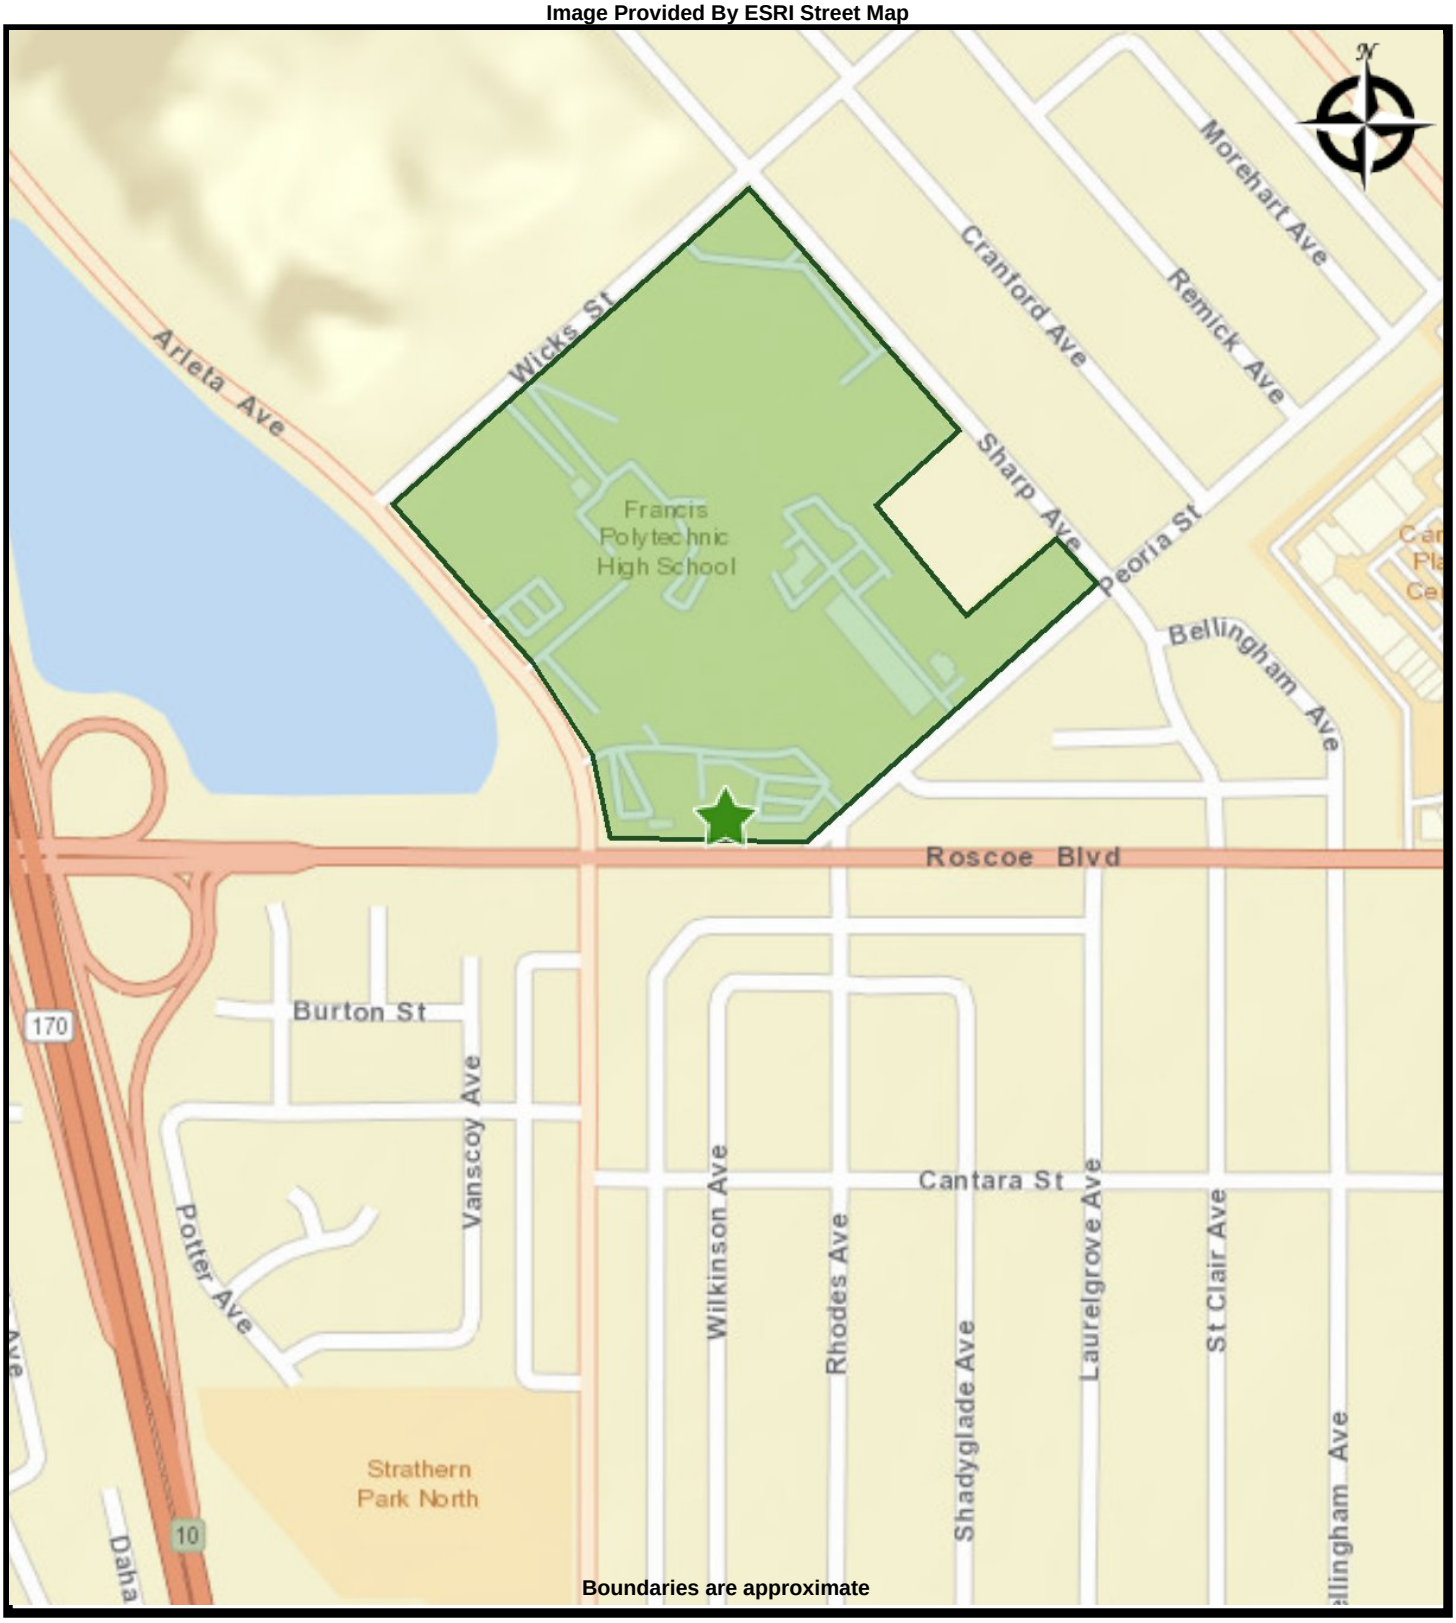
Microbial Contamination (Mold)

In accordance with the scope of work, the site reconnaissance is to include a visual inspection for indications of water intrusions or the presence of active mold growth on readily accessible interior and exterior surfaces. Confirmation sampling is not included in the scope of work for the Phase I ESA. Readily accessible areas of the building were observed for visual or olfactory indications of mold, and for areas of water damage. No indication of mold was observed.

CONCLUSIONS

CES Group has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-13 of Francis Polytechnic High School located at 12431 Roscoe Blvd, Sun Valley, CA. Any exceptions to, or deletions from, this practice are described in Section 3.2 of this report.

Based upon our understanding of the proposed project, there is a proposed modernization project at Franics Polytechnic High School that consists of the demolition of 11 buildings and approximately 16 classrooms, construction of 41 classrooms and 6 buildings, and additional site upgrades.



Based on the conclusions of this assessment, CES Group recommends the following:

- Consideration must be given to the management of the methane gas system during demolition and construction.
- Should construction activities involve the disturbance of ACM and/or suspect ACM and lead-based paint, proper management techniques should be employed for the handling of soil and demolition materials in accordance with all applicable environmental agency rules and requirements.
- Sampling the soils in the planter areas and between buildings that are planned for demolition or earthwork.
- Sampling the soil in the areas of the clarifiers.
  Sampling in the hazardous materials storage area to confirm that there has been no release.

EDR Property Tax Map Report

Environmental Data Resources, Inc.'s EDR Property Tax Map Report is designed to assist environmental professionals in evaluating potential environmental conditions on a target property by understanding property boundaries and other characteristics. The report includes a search of available property tax maps, which include information on boundaries for the target property and neighboring properties, addresses, parcel identification numbers, as well as other data typically used in property location and identification.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Civil-Environmental-survey Group were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2013. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EDR Environmental Lien and AUL Search

The EDR Environmental Lien and AUL Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 03/07/2016 has revealed that there is 1 NPL site within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

Federal Delisted NPL site list

Delisted NPL: The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may deleted from the NPL where no further response is appropriate.

A review of the Delisted NPL list, as provided by EDR, and dated 03/07/2016 has revealed that there is 1 Delisted NPL site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
SAN FERNANDO VALLEY	***GLORIETTA WELLFIELD***	***NW 1/4 - 1/2 (0.441 mi.)***	***42***	***155***

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 03/07/2016 has revealed that there are 2 SEMS sites within approximately 0.5 miles of the target property.

SAN FERNANDO VALLEY	***GLORIETTA WELLFIELD***	***NW 1/4 - 1/2 (0.441 mi.)***	***42***	***155***

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 2 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 2 RCRA-SQG sites within approximately 0.25 miles of the target property.

US INST CONTROL: A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

A review of the US INST CONTROL list, as provided by EDR, and dated 09/10/2015 has revealed that there is 1 US INST CONTROL site within approximately 0.5 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk

characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 05/02/2016 has revealed that there are 10 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, and dated 05/16/2016 has revealed that there are 2 SWF/LF sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, and dated 03/14/2016 has revealed that there are 2 UST sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 07/20/2015 has revealed that there is 1 FINDS site within approximately 0.001 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
SAN FERNANDO VALLEY	***NORTH HOLLYWOOD WELL***	***0 - 1/8 (0.000 mi.)***	***0***	***27***

Cortese: The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

A review of the Cortese list, as provided by EDR, and dated 03/28/2016 has revealed that there is 1 Cortese site within approximately 0.5 miles of the target property.

HWT: A listing of hazardous waste transporters. In California, unless specifically exempted, it is unlawful for any person to transport hazardous wastes unless the person holds a valid registration issued by DTSC. A hazardous waste transporter registration is valid for one year and is assigned a unique registration number.

A review of the HWT list, as provided by EDR, and dated 04/11/2016 has revealed that there is 1 HWT site within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 3 EDR Hist Auto sites within approximately 0.125 miles of the target property.

Summary Details:

Conditions at proposal October 15, 1984): San Fernando Valley Area l) is an area of contaminated ground water in the vicinity of the North Hollywood section of the City of Los Angeles, Los Angeles County, California. This area is part of the San Fernando Valley Basin, a natural underground reservoir that represents an important source of drinking water for at least 3 million people in the Los Angeles metropolitan area. The contaminated ground water, which underlies an area of approximately 5,l56 acres, contains trichloroethylene TCE) and perchloroethylene PCE), and to a lesser extent, carbon tetrachloride and chloroform, according to analyses conducted by the California Department of Health Services, as well as numerous local government agencies. The State s recommended drinking water guideline for TCE and PCE 5 and 4 parts per billion respectively) are exceeded in a number of public wells in this area. To alleviate this contamination, wells are eithertaken out of service or blended with water from clean sources to ensure that the public receives water with TCE/PCE concentrations below the State s guidelines. Status June 10, 1986): EPA and the Los Angeles Department of Water and Power are entering into a cooperative agreement for a remedial investigation of the San Fernando Valley Basin and a feasibility study targeted at Area 1, the most contaminated area. The RI is scheduled to begin in early 1986.

Site Description: The North Hollywood-Burbank Well Field is located within the North Hollywood National Priorities List (NPL) Site, which is one of four NPL sites in the San Fernando Valley. It is also located in the San Fernando Valley Groundwater Basin. The sites were proposed for inclusion on the NPL because of the discovery of trichloroethylene and other volatile organic contaminants (VOCs) in the groundwater. The San Fernando Valley Groundwater Basin comprises 112,000 acres of valley fill situated among the Coastal Ranges within the Los Angeles metropolitan area. The area is used for residential, commercial, and industrial purposes. Groundwater from the basin is distributed by various municipalities and water districts to the residents of the metropolitan area. The Los Angeles Department of Water and Power (DWP) operates the North Hollywood-Burbank Well Field to provide drinking water to the residents of the City of Los Angeles, located to the south of the San Fernando Valley. The San Fernando Groundwater Basin can provide drinking water for approximately 500,000 people residing in the San Fernando Valley and Los Angeles. In times of water shortages, the groundwater shortage can be drawn upon to supply about one million people. It is also an important source of water for the Cities of Burbank, Glendale, and San Fernando. The North Hollywood Operable Unit (NHOU) is one of two geographically-defined operable units within the San Fernando Valley (SFV) (Area 1) Superfund Site. The NHOU comprises approximately 4 square miles of contaminated groundwater underlying an area of mixed industrial, commercial, and residential land use in the community of North Hollywood (a district of the City of Los Angeles). The NHOU is approximately 15 miles north of downtown Los Angeles and immediately west of the City of Burbank, and has approximate Site boundaries of Sun Valley and Interstate 5 to the north, State Highway 170 and Lankershim Boulevard to the west, the Burbank Airport to the east, and Burbank Boulevard to the south. The EPA is the lead agency for the current and planned future groundwater remedial activities at the NHOU. The EPA's response activities at the NHOU are and have been conducted under the authority established in the federal Superfund law, the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended, 42 U.S.C. Section 9601 et seq. The lead state agency is the California Department of Toxic Substances Control (DTSC). The Los Angeles Regional Water Quality Control Board (RWQCB) has provided and continues to provide substantial support, particularly with the investigation and cleanup of sources of contamination in the SFV. The expected source of cleanup monies for the NHOU is an enforcement settlement with the Potentially Responsible Parties (PRPs). Prior to World War II, most land in the SFV was occupied by farms, orchards, and ranchland. By 1949, after the war, nearly all the land in Burbank and North Hollywood was occupied by housing developments, industrial facilities, retail establishments, and the Burbank Airport. Accompanying these land use changes in the 1940s was a substantial increase in population and groundwater withdrawals from the SFV. In the 1950s, the North Hollywood, Erwin, Whitnall, and Verdugo Well Fields were constructed by the Los Angeles Department of Water and Power (LADWP) in the North Hollywood area to meet the increasing demand for water. In 1968, groundwater withdrawals from the SFV were reduced to achieve "safe yield" from the basin, and more surface water was imported to the basin from external sources. In 1979, industrial contamination was found in groundwater in the San Gabriel Valley (to the east of the SFV), prompting the California Department of Public Health (CDPH; formerly the California Department of Health Services) to request that all

SAN FERNANDO VALLEY (AREA 1) (Continued) **1000709322**

major water providers in the region, including those in the SFV, sample and analyze groundwater for potential industrial contaminants. Trichloroethylene (TCE) and tetrachloroethylene (PCE) were consistently detected in a large number of production wells in the SFV at concentrations greater than Federal and State Maximum Contaminant Levels (MCLs) for drinking water. TCE and PCE were widely used in the San Fernando Valley starting in the 1940s for dry cleaning and for degreasing machinery. Disposal was not well regulated at that time, and releases volatile organic compound (VOC)-contaminated groundwater that extends from the NHOU to the southeast. To replace wells within the NHOU area contaminated by TCE and PCE, and to provide more operational flexibility for groundwater recharge and pumping in the SFV, LADWP constructed the Rinaldi-Toluca Well Field in 1988 and 1989, and the Tujunga Well Field in 1993. Based on the significant levels of groundwater contamination present in the SFV and the impact of that contamination on numerous municipal water supply wells, EPA added four SFV Sites to the National Priorities List (NPL) in 1986 and defined them as areas of regional groundwater contamination. Three of the four Sites (Areas 1, 2 and 4) are contiguous areas within whose boundaries are well fields that serve the water supply systems for the cities of Los Angeles, Burbank and Glendale. There is a large, continuous plume of groundwater contamination that runs through these three Sites. The fourth Site, Area 3, lies in the Verdugo basin, a geographically separate area of the eastern San Fernando Valley. In the SFV Area 1 Site, located at the upgradient end of the contaminated groundwater plume, the selection and implementation of the initial interim remedy - the Existing NHOU Extraction and Treatment System - for the LADWP's North Hollywood well field was given fast-track status because of the potential for contamination to spread to other well fields and areas of uncontaminated groundwater. In 1986, LADWP completed the Operable Unit Feasibility Study for the North Hollywood Well Field Area of the North Hollywood-Burbank NPL Site, which was the basis for selection and implementation of the Existing NHOU Extraction and Treatment System. The 1987 Record of Decision (ROD) for the Site selected the Existing NHOU Extraction and Treatment System as an interim groundwater containment remedy. In 1989, LADWP constructed the Existing NHOU Extraction and Treatment System with financial support from EPA. The Existing NHOU Extraction and Treatment System consists of eight groundwater extraction wells (NHE-1 through NHE-8), an air-stripping treatment system to remove VOCs from the extracted groundwater, activated carbon filters to remove VOCs from the air stream, and ancillary equipment. The treated groundwater is discharged into an LADWP blending facility where it is combined with water from other sources before entering the LADWP water supply system. The Existing NHOU Extraction and Treatment System commenced operation in December 1989 and remains in operation today. In 1989, EPA issued a ROD for the Burbank OU (BOU) of the SFV Area 1 Site. That ROD also selected an interim remedy (containment) for the VOC-contaminated groundwater within the Burbank area, where ten of the city's water supply wells had been shut down due to contamination. The BOU remedy, which provides treated water for the City of Burbank's water supply system, began operation in 1996 and remains in operation to this day. OU01 1991 ESD: In June 1986, the United States Environmental Protection Agency (EPA) evaluated the threat posed by a number of well fields within the San Fernando and Verdugo Groundwater Basins, and designated them as National Priorities List (NPL) hazardous substance sites. Industrial chemicals had been detected in groundwater from these areas. Although four sites in the basin were listed on the NPL, EPA and DWP are managing the investigation of the four sites and the adjacent area as a single project consistent with the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) Section 104(d)(4). The San Fernando Valley Groundwater Basin (SFVGB) has historically been, and continues to be, an important source of drinking water for the Los Angeles metropolitan area,

SAN FERNANDO VALLEY (AREA 1) (Continued) **1000709322**

including the unincorporated area of La Cresenta, and the cities of Burbank, Glendale, and San Fernando. The groundwater basin provides these communities with enough water to serve approximately 600,000 residents. Groundwater from the SFVGB is used for residential, commercial, and industrial purposes, and is especially important during years of drought. The groundwater that has become contaminated is difficult to replace. The current water supply from surface water may not always be available in the future because of periodic drought conditions and state and federal water rights issues. The Burbank Operable Unit (OU) was developed to address the areal extent of groundwater contamination that is presently generally located in the area of the Burbank Well Field and including any areas to which the groundwater contamination migrates. The Site is part of the SFV Area 1 (North Hollywood) NPL site and includes an area beyond that originally designated as SFV Area 1. The City of Burbank's production wells have been shut down because the water they produce contained trichloroethylene (TCE) and perchloroethylene (PCE) in concentrations exceeding state and federal maximum contaminant levels (MCLs). Consequently, the City of Burbank now purchases 100 percent of its water, which is imported supply, from the Metropolitan Water District of Southern California (MWD). On June 30, 1989, the U.S. Environmental Protection Agency (EPA) signed a Record of Decision (ROD) for the San Fernando Valley (SFV) Area 1 - Burbank Operable Unit (Burbank OU). The Burbank OU is the second OU, but is named OU03 at the SFV Area 1 NPL site. The purpose of this Explanation of Significant Differences (ESD) is to explain the significant differences between the interim remedial action originally selected in the 1989 ROD and the interim remedy which will be implemented at the Site. EPA is issuing this ESD in order to take into account technical data received after the ROD was signed in June of 1989 and to clarify any ambiguities regarding the selected remedy. An Explanation of Significant Differences addressing OU01 the San Fernando Site was completed in November, 1990. Operable Unit 3: The following gives a brief background of the Burbank Operable unit (OU) and a short summary of the remedy selected in the Record of Decision (ROD) and modified by Explanation of Significant Differences (ESD) 1. Further background information can be found in the ROD (dated June 30, 1989), and in ESD1 (dated November 20, 1990), as well as in other documents in the Burbank OU Administrative Record. In June 1986, the U.S. Environmental Protection Agency (EPA) evaluated the threat posed by groundwater contamination at a number of water supply wellfields within the San Fernando Valley and Verdugo groundwater basins. The chief contaminants of concern are trichloroethylene (TCE) and perchloroethylene (PCE). As a result of its investigation, EPA designated four wellfield areas as National Priorities List (NPL) sites. EPA is managing the four sites as a single project consistent with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Section 104(d)(4). The San Fernando Valley Groundwater Basin has historically been an important source of drinking water for the Los Angeles metropolitan area, including the City of Burbank. The groundwater basin provides enough water to serve approximately 600,000 residents. Groundwater extracted from the basin is especially important during years of drought. Due to contamination by volatile organic chemicals (VOC), including TCE and PCE, beneficial use of the groundwater resource has been partially lost. Surface water supplies have replaced the lost resource, but are costly, and may not be available in the future due to periodic drought conditions and the potential for changing water rights policy. The Burbank OU is located within the San Fernando Valley groundwater basin and encompasses wellfields which were operated by the City of Burbank prior to being shut down as a result of contamination. The Burbank OU was specifically developed to address this areal extent of groundwater contamination. The City of Burbank's production wells have been shut down since the early 1980s because of the presence of TCE and PCE in concentrations
